TITLE: The Third All-Union Conference on regularities in the formation
and distribution of endogenous mineral resource deposits

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geologicheskaya, no. 1, 1963,
126 - 128

TEXT: The Conference was held in Baku from September 18 to 23, 1962; it
was attended by 455 representatives from scientific and industrial geological
organizations including 24 Academicians and Corresponding Members of AS USSR and
AS of various republic, 49 Doctors-Professors and 164 Candidates of Geological
and Mineralogical Sciences. The Conference was opened by Academician D. I.
Shcherbakov, secretary of OGON, AS USSR. The program of the Conference was di-
vided into three main groups: a) regularities in the formation and distribution
of endogenous deposits in the Caucasus; b) regularities in the formation and
distribution of endogenous deposits of other folding regions of the Alpine cy-
cle; c) general problems of metallogeny. In group a) reports on basic features

EXCERPT : Cultivation of the fodder beet in Poland.

DATE : February, No. 3, 1969, No. 1769

NAME : Kuznetsov, A.

TOPIC : Fodder cabbage under various condition of sowing.

2. MUR. : Sov. s. kh. Leningrad, 1968,
No. 1, 52-59

SUMMARY : Under conditions of Siberia, fodder cabbage grows in
green bulk crop of about 100 carters, including 10 kg
200 kg of digestible protein. For sowing in the snow,
by sowing seeds or young plants in the soil in the
water line, the crop is higher by 10%, but higher costs
costs are required. Fodder cabbage is utilized for silo
and in the green bulk crop various sowing dates.
From one hectare of sprouts 200 kg of seeds can be obtained.

TITLE: On the Flexure of a Single Flexible Footing (K voprosu izgiba odinochnykh gibkikh fundamentov)

PERIODICAL: Dokl. AN AzerbSSR, 1956, Vol 12, Nr 3, pp 163-168

ABSTRACT: A general solution is given for the differential equation for the flexure of a beam resting on an elastic support:

$$\frac{d^2}{dx^2} [EI(x) \frac{d^2 y}{dx^2}] + k(x)y = 0$$

wherein E is the modulus of elasticity of the beam material and I(x) and k(x) are continuous or segmentwise continuous functions characterizing the changes in the moment of inertia and in the bearing coefficient k along the length of the beam. The solution is presented in the form of a summation of four linearly independent integrals with constant coefficients, which coefficients are expressed in terms of the initial parameters of

TITLE: On One Type of Axisymmetric Loading of an Elastic Half-space (Ob odnom osesimmetrichnom zagruzhenii uprugogo poluprostranstva)

PERIODICAL: Dokl. AN AzerbSSR, 1956, Vol 12, Nr 5, pp 319-324

ABSTRACT: The author proposes that the exact but, in his opinion, unwieldy solution of the problem of a normal concentrated force exerted within an elastic half-space be replaced by an approximate solution in which the condition $\sigma_z = 0$ at the boundary $z = 0$ is replaced by the weaker expression $\int \sigma_z dF = p$. This integral, taken over the entire boundary zone, must be equal to zero. The resulting simplification of the formulas is insignificant, however.

TITLE: Preparation of polyethylene surface for bonding by means of ultraviolet irradia-

diation

SOURCE: IVUZ. Neft' i gaz, no. 4, 1966, 103-105

TOPIC TAGS: polyethylene plastic, UV irradiation, adhesive bonding

ABSTRACT: Experiments were carried out in order to determine the optimum technological process for preparing the bonded surface of articles made of unstabilized low-pressure polyethylene. The irradiation of surfaces was performed at various distances from the UV lamp, for various periods, at various temperatures and pressures of the ambient medium consisting of air or oxygen. The polyethylene surfaces thus pretreated were bonded to steel by means of a cold-setting epoxy adhesive, and the bonded specimens were subjected to shearing tests. The maximum bonding strength (51.5 kg/cm^2) was achieved at a temperature of the medium (air) of 80°C , a distance of the specimen from the lamp of 40 mm and an irradiation time of 240 min. TITLE:

On Some Kinds of the Meteorological Service of Civil Aviation

PERIODICAL:

Meteorologiya i gidrologiya, 1959, Nr 10, pp 33 - 34 (JSSR)

ABSTRACT:

In connection with the development of civil aviation the network of the AMSG (Air Weather Station of the Civil Air Fleet) has been extended and improved. The network was lately equipped with ceiling projectors, meteorological remote stations, radio bearing apparatus, and radio teleprinters. Furthermore, phototelegraphic apparatus and instruments for the measurement of air transparency are being introduced at present. The author believes that it would be high time to introduce television and automation into the meteorological service of rayonno-dispecherskiye sluzhby (RDS) (Tower Control Areas) and komandno-dispecherskiye punk'y (KDP) (Control Towers). The TV units should be provided with a small transmitting camera, a multicore cable about 200-250 m long, and a video controller. Meteorological observations at take-off command posts are to be made in cooperation with sectional meteorological stations and by means of instruments for the measurement of air transparency.

TITLE: Effect of prolongators on the activity of hyperimmune foot-and-mouth disease serum *b*

SOURCE: Veterinariya, no. 6, 1966, 18-19

TOPIC TAGS: hoof and mouth disease, serum, experiment animal, virus, immunization, diagnostic drug

ABSTRACT: Hyperimmunization of guinea pigs with a suspension of foot-and-mouth disease virus containing aluminum hydroxide (AH) and a saponin greatly increases the activity of diagnostic serum, regardless of the virus type. In the authors' experiments, the optimum dose of AH was 1%, that of the saponin 0.5%. Hyperimmunization of guinea pigs with a virus suspension containing 1% AH yielded type O serum with a titer of 1:60; types A and C, 1:80. Hyperimmunization of the animals with 0.5% saponin yielded type O serum with a titer of 1:110 to 1:150; type A, 1:140 to 1:170; type C, 1:170. A pronounced inflammatory reaction was noted at

AUTHOR: Mustafayev, I.D., Secretary of the Azerbaiydzhan TsK KP

TITLE: Higher School in the Life of Soviet Azerbaiydzhan (Vysshaya shkola v zhizni sovetskogo Azerbaiydzhana)

PERIODICAL: Vestnik Vysshey Shkoly, 1957, # 11, pp 33 - 40 (USSR)

ABSTRACT: The author gives a description of the historical development of culture and education in Azerbaiydzhan from the XI century up to the present time. This country possesses a high cultural level which produced many famous personalities. The greatest progress, however, was achieved during the Soviet regime. Since 1921, various higher educational institutions were created in Azerbaiydzhan. Presently, there are 15 vuzes including important institutions such as the Industrial Institute imeni Azizbekov (Industri'nyy institut imeni Azizbekova), the University, the Institute of Medicine imeni Narimanov (Meditinskij institut imeni Narimanova), the Institute of National Economy imeni K. Marx (Institut narodnogo khozyaystva imeni K. Marks'a), the Pedagogical Institute imeni Lenin (Pedagogicheskij institut imeni Lenina), the Institutes of Agriculture and Engineering. During the period of their existence these vuzes have trained more than 100,000 specialists including 15,200 engineers, about 11,000 physicians,

Card 1/3

Higher School in the Life of Soviet Azerbaydzhan

6,500 agricultural specialists, 3,000 economists, and over 35,000 pedagogues. The Azerbaydzhan State University has now 8 faculties; i.e. physics-mathematics, chemistry, geology-geography, biology, history, linguistics, orientology, and law. There are correspondence sections at the faculties of physics-mathematics, biology, geography, history, law, and linguistics. Since its foundation 8,000 specialists were trained at the University. The number of graduates increases every year and at present amounts to 600 students annually. The total number of students is actually more than 3,000, since 2,000 are trained by correspondence courses. Much attention is devoted to the training of qualified scientific workers by post-graduate courses. The Azerbaydzhan Industrial Institute comprises 7,000 students; altogether the Institute has trained 14,400 geologists, industrial engineers, technologists, electrical engineers, designers and economists. The Azerbaydzhan Polytechnic Institute was founded in 1950. There are four faculties: construction, mechanics, hydro-melioration and transportation from which 2,000 specialists were graduated during the past 6 years. The Azerbaydzhan Institute of Agriculture is an important center for training agricultural workers. There

Card 2/3

Higher School in the Life of Soviet Azerbaydzhan

are 5 faculties, 39 chairs, equipped with laboratories, cabinets, test-plants, cattle-breeding farms, a veterinary clinic, a workshop and a library. The Institute has four laboratories and one correspondence training section with a total number of 9,300 students.

The following figures demonstrate the results of pedagogical education: in 1926-27 there were 5,467 teachers working at the Republic's schools. In 1956-1957 this number increased to 362,000. A high level of evolution was reached by the Azerbaydzhan Medical Institute imeni Narimanov and 500 physicians are graduated annually from its five faculties. During 35 years 11,000 physicians were trained at this Institute, most of them Azerbaydzhanians.

AUTHOR:Mustafayev, I. S.

TITLE:

On the Paleogeography of the Basin of the Period of the Productive Mass (K paleografii basseyna veka produktivnoy tolshchi)

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Neft' i gaz,
1959, Nr 2, pp 17 - 22 (USSR)

ABSTRACT:

On the basis of the systematical investigations of the lithofacies and the paleogeography of sediments of the productive mass carried out in the last ten years, and with due regard to the data found by other researchers the author tried to outline the area of the basin of the productive age both at the beginning and at the end of its existence. In the course of its geological history the basin of the productive mass presented a complex coastline with various bays, peninsulas, islands, sandbanks, etc. The coastline of the basin gradually spread (Refs 1,2). The basin of the productive mass underwent a transgression, the main trend being a lowering of the bottom of the basin. When the coastline expanded characteristic lithofacial

Card 1/4

On the Paleogeography of the Basin of the Period of the
Productive Mass

SOV/152-59-2-6/32

types of the mass formed in the various separated zones due to tectonic conditions and to the source of sedimentation. The sediments accumulated in the basin have undergone such great lithofacial changes that it is not possible to give even a rough and oversimplified scheme of the cross section. The characteristic lithofacial properties of the sediments found are only of local importance and cannot be used as a basis for stratigraphical comparisons. In the period of the final formation the basin of the productive age in the petroleum and gas bearing area of the Azerbaydzhanskaya SSR covered the territory of the Southeastern depression of the Great Caucasus. Including the entire area of the Apsheronskiy peninsula, as well as the Apsheronskiy and Baku groups of islands the basin extended further to the East across the Caspian Sea, covering a great part of the petroleum and gas bearing area of Turkmeniya (Refs 5,6). The analysis of the earlier ages of the development of the basin Black Sea - Caspian Sea shows that these basins connected with each other to the Pontus

Card 2/4

On the Paleography of the Basin of the Period of the
Productive Mass

SOV/112-53-2-6/32

along with other parts of the basin of the Miocene and Lower Pliocene formed a long depression stretching almost exactly from East to West. From the age of the productive mass onwards they were separated into two distinct basins and developed as independent down warping with characteristic features of the formation. Without going into detail with respect to bionomical physico-geographical and other conditions of formation it must be said that the further geotectonic development of the Caspian Sea was different from that of the Black Sea. The present configuration of the Caspian Basin exhibits the part of the trough formed at the end of the age of productive mass over a wide expanse - stretching from the southern coast of the Caspian Sea to the basin of Kama river in the North (Fig.). In spite of a separated zone of sedimentation with different tectonic conditions the entire process of sedimentation in the wide basin of the productive age was dominated by uniform laws which applied exclusively to this body of
