Title : Raising the power factor of the auxiliary installations
of power stations

Periodical: Elek. sta., 4, 33-34, Ap 1958

Abstract : The authors discuss the necessity of improving the power
factor of auxiliary circuits which usually varies between
0.72 and 0.75. The authors mention that the power factor
in the industrial networks sometimes reaches a value of
0.882. The economic and technical factors are also
discussed.

B

TITLE: Development and introduction of spark connection and forcing of reactors
in long distance electrical transmission

SOURCE: Elektrichestvo, no. 4, 1965, 14-19

TOPIC TAGS: electric power transmission, electric distribution equipment,
high voltage line

ABSTRACT: The introduction of high voltage, high power electric power trans-
mission was greatly aided by the switch from limiting power to suit the capa-
city of insulation and transmission structures under all possible conditions
to the limitation of loads to suit the capacities under normal conditions and
the installation of reactors and circuit breakers to prevent sudden overloads.
One remaining problem was the slow action of mechanical switching devices.
This has been defeated by the installation of spark gaps. The reactors are
constantly connected to the line through spark gaps, across which a spark arcs
almost instantaneously in case of overload. A 500 kv transmission line was

Card 1/2

UDC: 621.311.1

Z

L 16459-66
ACC NR: AP6009074

set up between the Bratsk power station and Irkutsk and tests and analysis of the operation of the equipment described were run. It was discovered that overloads occurred mostly in the second or third half-cycle of operation. It was also discovered that it is profitable to install spark-operated reactors at substations, even at terminal stations in many cases. Diagrams and photographs of the equipment, as well as a table showing the results of investigations on a model of internal overloads and the influence on them of various means of connection of the 500 kv reactors, are presented. Analysis showed that the devices worked reliably and safely, and that the internal resistance of the spark in the gap could be ignored. Orig. art. has: 4 figures and 1 table. [JPRS]

Coloring of glass by nickel. Jiri Nejedlý, Milota Panderová, and EM Kocík (Glass Research Inst., Prague)

The effect of nickel on the coloring of glass was studied. It was found that the absorption curves of transparent glass containing 0.1% nickel at 200°C and 700°C respectively, show a change of absorption curves of 100%. This difference was explained by the change in forces binding Ni to the glass structure. Transparent glass was prepared from 25% SiO₂, 43% Na₂O, 13% CaO, 10% Al₂O₃, 5% MgO, 2% NiO, 1% MnO₂, and 2% K₂O.

Title : Current-Conducting Glass

Orig Pub: Sklar a keramik, 1956, 6, No 11, 273-278

Abstract: A review of the technology of production of electric current conducting glass (EG) and of the patents relating thereto. EG is manufactured by two concerns in the United States and by one in Belgium. Production of EG is based on 3 methods: a) reduction of the surface film (having a thickness of 50-100 Å) of heavy lead

Card 1/4

Czechoslovakia /Chemical Technology. Chemical Products I-12
and Their Application

Silicates. Glass. Ceramics. Binders.

Abs Jour: Referat Zhur - Khimiya, No 9, 1957, 31509

glasses, containing more than 60% PbO, by means of H at 250-550 ; b) deposition of a film of metal salts on the surface of the glass, followed by their reduction to the metal; c) deposition upon the glass of a conducting film of oxides or other metal compounds. The 1-st method yield an opaque glass of low conductivity (resistance of 1 m² is of about 10⁹ ohms); 2-nd method is very complex and yields a glass of low transparency but high conductivity (25-150 ohms/m²). The most practical is the 3-rd method which is used in the United States. The conducting surface layer consists

Card 2/4

Abs Jour: Referat Zhur - Khimiya, No 9, 1957, 31509

mostly of SnO_2 , which is formed from SnCl_4 by treatment with H_2O , and has characteristics that are typical of semi-conductors. EG produced by this method is practically transparent, can be made of any resistance (from 20 to several thousand ohms/m²). The principal fields of utilization of EG are: electric heating of rooms by means of windows, walls and ceilings made of EG, kitchen utensils, windshields of aircraft, cars and railroad engines, and high-frequency engineering, where EG can be utilized to dissipate electric charges that build-up on cathode-tube shields and bulbs.

and Their Application

Silicates. Glass. Ceramics. Binders.

Abs Jour: Referat Zhur - Khimiya, No 9, 1957, 31509

A drawback of EG is the high consumption of electric power, for which reason the authors do not consider it necessary, as yet, to undertake extensive manufacture of EG in Czechoslovakia.

3131. A CASE OF FAMILIAL INCIDENCE OF NARCOLEPSY - Případ rodinného výskytu narkolepsie - Nebušmal O. and Roth B. Neurol. Klin. KU. Praha - ČSL. NEUROL. 1958, 21/1 (54-58)

Description of a family in which 8 members were affected by narcolepsy within 3 generations. The authors examined 4 of those affected. All of them suffered from narcoleptic attacks and had signs of sleep dissociation (sleep paralysis, hypnagogic hallucinations, automatic behaviour). 2 showed cataplexy, while the 3rd had attacks of narcolepsy caused by emotion. In 2 cases signs of sleep drunkenness were found. One patient showed bilateral chronic progressive nuclear lesions of the oculomotor nerve and in addition bilateral lesions of the acoustic nerve. The relation of essential narcolepsy to independent sleep drunkenness as well as the existence of transitory forms between both diseases is stressed. The possible association of narcolepsy with bilateral lesions of n. II, n. III, and n. VIII is pointed out. These lesions have been described only in familial forms of narcolepsy.

AUTHOR: Nebylitsyn, V. D.
TITLE: On the examination of the reliability of the work of human operators in automatic systems
PERIODICAL: Referativnyy zhurnal, Matematika, no. 7, 1962, 81, abstract 7V398. ("Vopr. psichologii", 1961, no. 6, 9-18)

TEXT: Discussed are the general problems concerning the reliability of a control system having a human operator as the principal link. The author says that the variety of factors which guarantee the reliability of the human link can be divided into three main groups: 1) the perfection of the apparatus from the engineering-psychological standpoint, and the qualifications of the operating personnel; 2) training, in particular the ability for training; 3) factors of basic individual character, in most cases the individual differences between operators relative to reliability depend on just such factors. To these groups belong anatomic-physiological factors (blood pressure, condition of the inner organs, vegetative sensitivity); psycho-physiological factors (the properties of the higher nerve activities of the individual: the strength of the nervous system in relation to the stimulus).

TITLE: Individual difference factors in bioelectric brain potential reactions to rhythmic light stimuli

SOURCE: Zhurnal vysashchey nervnoy deyatelnosti, v. 14, no. 2, 195-203

TOPIC TAGS: recruitment, recruitment index, EEG, brain bioelectric activity, light stimuli, individual recruitment difference, alpha frequency band, beta frequency band, theta frequency band, conditioned reflex, nervous system activity, intercorrelation of recruitment indices

ABSTRACT: Recruitment reactions to light stimuli frequencies were investigated in 15 men and 10 women, ages 20-32 yrs. The subjects were placed in a dark soundproof chamber and EEG were recorded while they were in a reclining position with eyes open. EEG were recorded bipolarly, and special frequency band filters made possible the simultaneous recording of their components: theta rhythm (5-7 cps),

Card 1/3

ACCESSION NR: AP4031816

alpha rhythm (9-12 cps), and beta rhythm (14-25 cps). Light stimuli were produced by an EFS-01 photostimulator with varied frequencies and intensities. With an integrator switched into the system, electrical activity could be measured quantitatively in terms of energy. To find accurate recruitment indices, the oscillation energy value of a frequency band was measured during continuous light stimulus and then during flashing light stimulus for the same length of time (10 sec) and the same intensity. The recruitment index was based on the difference between the two values. Recruitment indices were found for six intensities ranging from 25 to 1000 lux. Conditioned reflexes to sound stimuli were also investigated. Recruitment is found for theta, alpha, and beta rhythms and its effect is highest at 12 cps and lowest at 5 cps. The electrical reactions formed in the cortex during different frequencies of stimulation apparently depend on different factors of the nervous system. The relation among low frequency recruitment (theta rhythm band), cortical electrogenesis, and the cessation rate of activated conditioned reflexes indicates a certain dependence of all these indicos on nervous system activity. Individuals with a weak nervous system display a tendency for recruitment within a wider frequency range.

TITLE: Further study of the influence of conditions of space flight ² on chromosomes of primary roots of pea and wheat sprouts

SOURCE: Kosmicheskiye issledovaniya, v. 1, no. 1, 1963, 186-191

TOPIC TAGS: space flight effect, chromosome reconstruction, 660 Mev proton, cobalt 60 Gamma ray, Vostok 1, Vostok 2, Vostok 3, Vostok 4

ABSTRACT: Dry seeds of winter wheat (PPG-186) and peas ("Kapital" variety) were exposed to effects of space flight on the four Vostok spaceships. A cytological analysis of the sprout roots of seeds indicated that exposure to space flight resulted in a small but statistically significant increase in chromosome reconstructions. The percentage of reconstructions does not depend on the duration of flight. More reconstructions were found in seeds flown in Vostok-2 than in seeds flown in Vostok-3, in which there was a distinct,

Card 1/2

L 19453-63

ACCESSION NR: AP3007352

but not statistically significant increase. There was no increase in the number of reconstructions in seeds flown in Vostok-4. Control seeds were subjected to radiation and vibration in an attempt to identify which aspects of space flight were responsible for the increase. Exposure to vibration (70 cps; amplitude, 0.4 mm) for 4 hr did not increase the number of reconstructions. Exposure of seeds to 660-Mev protons (dose 1940 rad; rate, 43/min) was no more effective as far as the number of reconstructions is concerned than exposure to Co⁶⁰ γ -rays (dose, 1940 rad; rate, 289/min). ABSTRACT: A firing pin for a firearm for center and edge firing swinging through 180° is described. The distinguishing feature of the device is that on the frame is mounted an insert with an eccentric opening to receive the firing pin cushioned by a spring. At the same time, by means of a recess the insert and the firing piece are secured in the operating position by a bolt across the frame of the firearm.

Author proves the existence and uniqueness of the solution of the biharmonical problem (plane problem of the theory of elasticity) for an infinite wedge. Biharmonical problem for a plane polygon is also solved. Mellin's transform is used and discussed in detail. Practical calculation is performed by introducing the four Green functions obtained through the formal use of the convolution theorem. Difficulties involved in the numerical calculation are completely studied.

TITLE:

On boundary values of the function which have a finite Dirichlet integral

PERIODICAL: Aplikace matematiky, v. 5, no. 3, 1960, 202-208

TEXT: This article describes the conditions for a function (which is defined at the boundary of a region) that permit its continuation over the whole region; this continuation has a finite Dirichlet integral. The author first refers to the main works in this field of S.M. Nikol'skiy (Ref. 4: K zadache Dirikhle dlya kruga i poluprostranstva [Dirichlet's problem for a circle and a half-space], Matematicheskiy sbornik, tom 35, 1954, 247-265), T.I. Amanov, E. Gagliardo, G. Prodi, L.N. Slobodeckij and V.M. Babic [Abstractor's note: No references given for the latter five individuals], L. de Vita (Ref. 5: Sulle funzioni ad integrale di

Card 1/13

21374

Z/026/60/00^c/00^c '002 '00^c
D221/D302

On boundary values of the ...

is defined at the boundary Ω and has there a limited Dirichlet integral, is that it can be quadratically integrated at the boundary, as follows from the theorems by S.L. Sobolev [Ref. 1: Nekotoryye primeneniya funktsional'nogo analiza v matematicheskoy fizike (Some Applications of Functional Analysis in Mathematical Physics), Leningrad, 1950]. It is stated here that the function f which is defined over Ω has a finite Dirichlet integral if the first derivatives of function f over Ω can be quadratically integrated. Symbolically expressed, $f \in W^{(1)}(\Omega)$. By the Dirichlet integral we mean the term $\int_{\Omega} \left[\left(\frac{\partial f}{\partial x} \right)^2 + \left(\frac{\partial f}{\partial y} \right)^2 \right] d\Omega$.

Theorem 2 states: "If f lies in $W(\Omega)$ only then when it lies in $W(K)$." [Abstractor's note: K denotes a circle]. A short basic proof of the first part of the statement can be proved in the same manner. Theorem 3 states:

Card 3/13

21374

Z/026/60/005/00²/002/005
D221/D302

On boundary values of the ...

"f lies in $\mathbb{W}(K)$ only then when it lies in $\mathbb{W}(K_C)$." Abstractor's note: Here K_C is the exterior of the unit circle. The proof of this theorem is obtained directly by applying the inverse mapping. Theorem 4 which follows from Theorem 3 states: "f lies in $\mathbb{W}(A)$ only then when it lies in $\mathbb{W}(\Omega)$." Abstractor's note: Here Ω_C is the complement of $\bar{\Omega}$. It follows from Theorem 2 states the author that one can limit oneself to the unit circle. Theorem 5 states: The necessary and sufficient condition that $f \in \mathbb{W}(K)$ is that

$$\sum_{k=1}^{\infty} k(a_k^2 + b_k^2) < \infty \text{ where (1) } a_k = \frac{1}{2\pi} \int_0^{2\pi} f(s) \cos ks ds,$$

$$b_k = \frac{1}{2\pi} \int_0^{2\pi} f(s) \sin ks ds. \text{ The proof of this theorem is very simple}$$

Card 4/13

21374

Z/026/60/005/007/002,005
D221,D302

On boundary values of the ...

and can be found in R. Courant (Ref. 2: Dirichlet's principle, conformal mapping and minimal surfaces. New York 1950). Theorem 6 states: The necessary and sufficient condition that $f \in W(K)$ is that

$$\int_{-\pi}^{\pi} \left[\frac{f(\varphi + t) - f(\varphi - t)}{t} \right]^2 dt < \infty. \text{ The proof of this theorem}$$

can be found in G. Freud and D. Králík (Ref. 3: Op.cit.). Theorem

7 states: Let $f \in W(K)$. Then $\int_{-\pi}^{\pi} [f'(\varphi + s) - f'(\varphi - s)]^2 ds \leq M/t$, where

M is a constant. The proof of this theorem can be found in the article by S.M. Nikol'skiy (Ref. 4: Op.cit.). Theorem 8 states: Let M be a constant such that

Card 5/13

On boundary values of the ...

21374
Z/026/60/005/003/002/005
D221/D20?

$\int_0^{2\pi} |f(s+h) - f(s)|^2 ds \leq M/h^{1+\epsilon}$, where $\epsilon > 0$. Then $f \in W(\dot{K})$. The proof is given in the abovementioned article by S.M. Nikolskij (Ref. 4: Op. cit.). Theorem 1 states: Let $f(s)$ be a Hölder function with the power $\frac{1}{2} + \epsilon$ where $\epsilon > 0$ (i.e., $|f(s+h) - f(s)| \leq M/h^{\frac{1}{2} + \epsilon}$, M is a constant). Then $f \in W(\dot{K})$. As proof the author states that in fact $\int_0^{2\pi} |f(s+h) - f(s)|^2 ds \leq 2\pi M^2/h^{\frac{1}{2}+2}$, this $f \in W(\dot{K})$ according to Theorem 8. The absolute continuity of function f is not sufficient for $f \in W(\dot{K})$ and a counter example is given by L. de Vita (Ref. 5: Op. cit.). Theorem 1C states: "Let f

Card 6/13

21374

Z/026/60/005/001,002,005
On boundary values of the ... D221/D302

be an absolutely continuous function" and let (2)

$$\int_0^{2\pi} |f'(s)| \lg^+ |f'(s)| ds < \infty. \text{ Then } f \in W(K)(\lg^+ |f'(s)|) -$$

= Max (0, $\lg |f'(s)|)).$ As regards the proof, it follows from Theorem 6.36, p. 138 of the monograph by A. Zygmund (Ref. 6: Trigonometrical series. Warszawa - Lwów, 1935) that the condition (2) is

sufficient for $\sum_{k=1}^{\infty} |a_k|^2 + |b_k|^2 < \infty,$ where a_k, b_k are Fourier's

coefficients of function f according to (1). Hence the function

$$\varphi(s) = \sum_{k=1}^{\infty} a_k \sin ks - b_k \cos ks \text{ is limited on the unit circle.}$$

Card 7/13

21374

On boundary values of the ...

Z/026/60/005/003/002/005
D221/D302

X

According to Theorem S. 154 in (Ref. 6: Op. cit.) condition (2) and the "boundedness" of function φ are sufficient for

$$-\frac{1}{\pi} \int_0^{2\pi} f'(s) \varphi(s) ds \leq \underset{\zeta \in \Gamma}{\zeta} k(a_\zeta^2 + b_\zeta^2) \quad \text{to be valid and hence the}$$

theorem is proved. Theorem 11 states: "If f is absolutely continuous and if

$$\int_0^{2\pi} |f'(s)|^p ds < \infty \quad \text{where } p > 1, \text{ then } f \in W(K)."$$
 As proof

the author states that it follows from Sobolev's theorems that if $f \in W(K)$ then

$$\int_0^{2\pi} |f(s)|^p ds < \infty$$

for any $p > 1$. Theorem 12 states:

On boundary values of the ...

Let $\int_0^{2\pi} |f(s + h) - f(s)|^2 ds \leq M/h$, where M is a constant. Then

$\int_0^{2\pi} |f(s)|^p ds < \infty$ for any $p > 1$. With regards to part f, there is

$$(3) \int_0^{2\pi} |f(s + h) - f(s)|^2 ds = 4\pi \sum_{k=1}^{\infty} (a_k^2 + b_k^2) \sin^2 \frac{kh}{2} \leq M/h. \text{ Let } q$$

be an arbitrary number $1 < q < 2$, and let λ be $0 < \lambda < 1$, and $\lambda \frac{q}{2-q} > 1$:
from (3) follows (4) \times
