ACCESSION NR: AP4000269

S/0219/63/056/011/0039/0043

AUTHOR: Negovskiy, V. A.; Soboleva, V. I.; Gurvich, N. L.;
Kisseleva, N. S.

TITLE: Deep hypothermia as a method for prolonging clinical death
periods

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 56,
no. 11, 1963, 39-43

TOPIC TAGS: hypothermia, clinical death, resuscitation process,
resuscitation process inhibitor, loss of blood, blood loss, acute
blood loss, blood infusion, intraarterial infusion, intraarterial
blood infusion, blood perfusion, heart dilation, hemodynamic
disturbance, metabolic acidosis

ABSTRACT: In two groups of experimental dogs body temperature was
reduced to 20-23°C and venesection was performed to induce clinical
death. Animals were revived after clinical death of two hours with
heat, blood perfusion, artificial respiration, defibrillation, and
heart stimulation. Electrocardiograms were recorded during the entire
experiment. In the first group of 23 dogs only 5 animals survived

ACCESSION NR: AP4000269

clinical death with complete restoration of their vital functions. All other animals in this group either died within 2 days after the experiment or failed to revive at all. Resuscitation failure was attributed to imperfect blood perfusion causing acute heart dilation, marked hemodynamic disorders during restoration period, and severe acidosis inhibiting further restoration and leading to serious changes in the brain and internal organs. These factors were controlled in reviving the second group of 8 dogs, and fresh donor blood and blood substitution were also used in the later stages of revival. All 8 animals were revived and vital functions were completely restored in 5 of the animals. Thus, under deep hypothermia clinical death can be prolonged to 2 hrs with subsequent complete restoration of vital functions. Orig. art. has: none.

"Timely Questions of Medicine," Vol. 1, No. 1, 1960, pages 1057-1061.
Budapest, Cvycvi Ház.

Abstract: The author discusses the phenomenon of organotropism as a biological mechanism. The indications for resuscitation by external respiration, oxygen transfusion, artificial respiration, heart infarction, etc., are discussed in detail. The resuscitation of the newborn with asphyxia and the possibilities for prevention of clinical deaths are presented. No reference.

Plankton

Orig Pub : An. Rom-Sov. Ser. biol., 1957, 11, No 4,
122-146

Abstract : The results of work carried out in 1954-1956
are described. 10 species of phytoplankton
were found, of which 4/ species were diatom
and 27 species dinoflagellates. The mass form
of Rhizosolenia calcar avis is encountered
during the period of "blossoming" in numbers
higher than 500 thousand cells in 1 m³ of
water, which constitutes a biomass of 10.44

mg/m³. In the same volume of water up to 2⁹ million cells of *Thalassionema nitschkei* may be counted. In 1955, the highest density of dinoflagellates was recorded for October (24.88 mg/m³) and of diatoms for August-December (up to 15 mg/m³). Among the representatives of zooplanktons, Cladocera develop mainly in the upper layer of the water during the warm season of the year. Podon polyphenoids and *Penilia avirostris* predominate. There are 9 species of Copepoda. Of them *Oithona minuta* and *Anamalocera pateroni* were detected for the first time in Rumanian waters. In the summer and fall of 1955 up to 30 thousand of *O. minuta* were counted in 1 m³ of water. In 1955, the

pp 24-25
ABSTRACT: Recent Soviet tests in the Pacific Ocean with heavy
earth satellites have shown the possibility of
launching manned space ships in the near future.
Soviet scientists have also studied the problem of
space ships re-entering the atmosphere and the
landing on other planets. The article refers to
the third artificial 1,327-kg Soviet satellite with
a speed of 8,000 m/sec and a kinetic power of
approx 4 billion km. Reference is made to the
theoretical and experimental research of Soviet
scientists Elzaser and Sirovatskiy who developed
the science of magneto-aerodynamic braking of space

Study of Properties of Sheepskins Used for Imitation of Cypu Fur.
Anuarui, lucrar. stiint. Inst. agron., 1957, 335-341.

Abstract: The properties of skins of adult lambs with fine lanolin wool (1.5-2%) were studied; imitated cypu fur (Nutriet) is produced of these skins after processing them by tanning, crusting, clipping, dyeing and smoothing. Lamb skins of the improved sheep breed Spanka were studied with a view to improve the quality of the raw material for manufacturing high quality Nutriet. The lambs are slaughtered 5½ to 6½ months old, when they weigh not less than 20 kg, having been fed well or above the normal. It is shown ~~now~~ that the breeding and selection of sheep should be carried out taking into consideration the following specified mean qualitative indices in order to avoid any losses in the wool production and of meat and milk: wool thickness - 1.9-2.0 mm, wool density - 400-4500 fiber per sq.cm, the uniformity and elasticity of wool and skin, as well as the sausinity and softness of wool must be good, wool strength, 1.36-1.46 g, elongation - 1.4%, derma thickness - 2.32 mm; living lamb weight - 21.2 kg, meat yield - 46%, raw skin weight - 1.4 kg, raw skin area - 70 square inches. Grading of the studied skins of sheep of the improved breed Spanka after their processing resulted in 57.5% of I class skins, 37.5% of II class skins, 3.7% of III class skins and 1.2% of scrap.

TITLE: Determination of the force characteristics of one-seat adjusting valves
with nozzles in steam turbines

SOURCE: Constructia de masini, no. 1, 1966, 14-15

TOPIC TAGS: steam turbine, valve, turbine design

ABSTRACT: A report on the deviations from theoretically calculated values of the experimentally determined real forces in a number of one-seat valve types used in steam turbines. On the basis of the results, the authors offer some suggestions as to the choice of types and dimensions so as to obtain real forces which are larger than the theoretical ones. T.F. art. has: 8 figures and 4 formulas.

TITLE: High-power transistorized blocking-generator

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,
no. 6, 1962, abstract 6-7-229 d (Automat. si electron.
1961, 5, no. 4, 164-175)

TEXT: The operation of a blocking-generator, devized for producing pulses of high output power (≈ 50 W), is investigated analytically. The cycle of operation was split into 4 stages, each being represented by a separate equivalent circuit. Recommendations concerning the choice of the transistors, circuit elements and transformers are given as a result of the analysis. The experimental results are sufficiently close to the theoretical ones. 13 references.

Oil content of grape seed of the principal cultivated varieties and optimum conditions for obtaining oil. S. Caglianese and R. Negriani. *Annals Ital. Accad. Naz. Lincei* 19, 121-30 (1941). *Bud. Abstracts* 22, No. 6, 1458 (1940). The oil content of grape seed varies according to the variety, the soil, the climate and the vigor of the vine. In analyzing 81 varieties of Romanian and foreign grapes, it was found that the seed of Roman varieties contained an av. of 14.1% of oil and the seed of foreign ones 14.0%. Seed of red varieties were lower in oil content than the white. Varieties having wine of the highest alc. content were also those with seeds of the highest oil and sugar content. The best solvent for the oil was ethyl ether but petr. ether was nearly as satisfactory and much more economical. Grinding the seed and making a hot extn. increased the oil recovery. R. D. H.

Influence of a Mantis - "Podvoy".

Orig Pub : Bul. stiint. Acad. RPR. Sec. biol. si stiinte agric.,
1956, 8, No 3, 657-666

Abstract : Young hybrid grape seedlings were grafted to old vines.
The grafted seedlings produced grapes with a different
average weight, sugar content, acidity, color and taste.
In most cases the difference was a larger growth and
bigger fruits that had an increase in their sugar con-
tent. The grapes were found to change in color from
black to pink and from black to white. One of the root

Title : Artificial Additional Pollination in the Grapevine.

Trig Pub : An. Inst. cercetari agron., 1956, 23, No 4, 371-382

Abstract : When the viticulture division of the Agronomical Institute applied artificial additional pollination (dooplynie) on self-sterile, functionally feminine, varieties, the yield increase was 26.4% over varieties pollinated freely. In the Koada vulpina variety the average weight of the bunch increased from 114.3 to 699 grams. In self-fertile varieties the yield increased through pollination with a pollen mixture: by 43.5% with the Aligote, by 10.6% with the Riesling, and by 27.6% with the Traminer. Ro

Title : Growing the Grape Vine from Seeds in the Feed Pots.

Ori., Pub : Gradina, via si livada, 1957, 6, № 1, 55-57

Abstract : A 100% germinating ability of the seeds was achieved at the experimental station of viticulture in Valya Keluge-ryaske (RNR, 1956) in growing grape vine from hybrid seeds in feed pots. The feed pots contained the following: 3 parts of peat, 1 part of sawdust, 1 part of virgin soil and $\frac{1}{2}$ part of cow manure diluted with water 1:1. 0.5 g N₂, 4 g P₂O₅ and 0.5 g of potash are added to each 1 kg of the mixture. 12-14 days before sowing, the seeds were soaked in water at the temperature of 30°. Due to this the seeds sown March 27-30 produced sprouts April 6-11, and on the 75th day the vine was 70 cm in height.
