296. NIELUBOWICZ J. I Klin. Chir. A.M., Warszawa. *Badania doświadczalne nad patomechanizmem wzdęcia. Experimental investigation on the pathomechanism of tympanites POL. TYG. LEK. 1956, 11/1 (20-28) Illus. 11

After radiological investigations the author agreed with the views of Wangensteen that intestinal gas is chiefly derived from air entering the oesophagus at the inspiratory phase of respiration. For this to take place there must be a dysfunction of the oesophageal orifice which becomes wider in a variety of different pathophysiological conditions such as pain, fear, paralysis, narcosis, etc. In these cases some of the inspired air enters the stomach instead of the lungs. Over 3 consecutive days the author made radiological observations. On the first day screening showed how the empty stomach became filled with air after the subject had breathed deeply 3 times and then held his mouth shut. The total air in the stomach increased with further inspirations. On the 2nd day of the test under the same circumstances a column of air was seen passing from the oesophagus to the stomach. On the 3rd day air was passed into the stomach by a tube to give a feeling of 'fullness' and the X-ray tube lowered progressively to the lower part of the stomach. These investigations confirm that the aspiration mechanism is the foremost cause of intestinal gas in normal and pathological states and notably post-operatively. These tests can also be used to estimate bowel function in constipation (Zawadowski) and they demonstrate the main cause of tympanites.

"Experimental homoic- and Heterotransplantation of Blood Vessels Sterilized by Gamma Irradiation."

Budapest, Orvosi Hetilap, Vol 103, No 46, 18 Nov 62, pages 2197-2201.

Abstract: [Author's summary] Previously infected arteries can be sterilized by gamma radiation. Treated thusly, their histological structure of elasticity remained unchanged. The time required for sterilization was 5-10 minutes for strong, 45-90 minutes for weak radiation. Transplantations with the irradiated arteries were successful. Use of blood vessels kept in a bacterial culture for 24 hours before irradiation were not suitable. In spite of sterilization, these were destroyed in 5-11 days after the transplantation. The complication was probably due to the proteolytic effect by the enzymes of the bacteria on the arterial wall. "Neurological Symptoms in Insulinoma Pancreatis."

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 21, 20 May 63, pp 750-753

Abstract: [Authors' English summary modified] Authors describe a case of a woman with frequent onsets of unconsciousness and psychomotoric agitation while fasting and sometimes accompanied by paresis. Blood sugar during the incidents was low, and the glycemio curve was flat. Incidents disappeared on the administration of glucose. Secretive insulinoma of the pancreas diagnosed and treated surgically with success, as they usually are. The 11 references comprise four (4) in Polish and seven (7) Western.

The investigations were performed in 25 cases of hyperthyroidism and in 10 controls with Gruesbach's and Harris' staining-haematocrit method, using Congo red. The maximum error of the method is stated to be 5%. The increase in the volume of circulating blood in hyperthyroidism depends on the severity of the disease. In mild cases the difference in blood volume before and after treatment ranges within the limits of the method's error. In severe cases the increase of the total blood volume may be 5 - 15%. A correlation was observed between circulation time (decholine) and circulating blood volume. The greatest increase of the latter was observed in cases in which the decholine test exceeded 9 sec. No correlation was found between the increase of the BMR and that of the blood volume.

AUTHOR: Niemand, L.

TITLE: Uniform nomenclature of the efficiency coefficients of aircraft engines

SOURCE: Warsaw. Politechnika. Zeszyty naukowe, no. 93, 1964. Mechanika, no. 13, 3-18

TOPIC TAGS: aircraft engine, engine efficiency, energy balance, jet engine, rocket engine, turboprop engine

ABSTRACT: The definitions of the efficiency of aircraft engines which are found in the technical literature are approximate in character because they are formulated on the basis of certain simplifying assumptions. The simplification consists of neglecting, in the energy balance, the effect of the kinetic energy of the fuel which is being displaced together with the engine, at a velocity equal to that of the aircraft with respect to the earth. For practical purposes the accuracy of these formulas is entirely sufficient, but their mathematical interpretation leads to conclusions which are physically meaningless: for instance, that the drive efficiency or general efficiency of an aircraft engine can be greater than unity. The

Card 1/3

L 33919-65
ACCESSION NR: AP5002967

purpose of this paper was to formulate the energy balance of an aircraft engine correctly in both the reference system connected with the earth and the reference system connected with the aircraft, and thus to obtain a clear idea of the nature of energy transformations in the engine. Correct formulas are derived for the efficiency coefficients of the following types of aircraft engines: internal combustion engine, jet engine, rocket engine, turboprop engine. For the case of a jet engine, the dependence of the drive efficiency and general efficiency on the ratio of the flight velocity to the velocity of the gases from the nozzle is established. The process of expansion of gases in the turbine of a jet engine with and without a diffuser behind the turbine is also investigated. The mathematical interpretation of these formulas leads to conclusions which are physically sound and to a better understanding of the mechanism of the conversion of the energy contained in the fuel into the work of the thrust produced in the engine. The efficiency coefficients of stationary internal-combustion engines are seen to be a particular case of the above-mentioned formulas where the flight velocity is set equal to zero. Orig. art. has: 3 figures and 43 formulas.

Title : The Effect of Royal Jelly Upon Working Bees

Orig Pub : Pszczelarstwo, 1957, 8, No 8, 229-231

Abstract : For a period of 14 days the following mixtures were fed to young working bees which have been placed into cells at a temperature of 32° (C) (thermostat) in groups of 20-40 bees each: 1) sugar syrup (1:1) with royal jelly in doses of 0.0217-0.5 mg per 1 ml of syrup; 2) 1 part of water plus 2 parts of honey and royal jelly in doses of 0.005-0.5 μ g per 1 mg of honey solution. Royal jelly did not reduce the mortality of bees.-- V.A. Kanzyuba

Title : The Effect of the Spritz-Hornit Herbicide Upon Adult Bees

Orig Pub : Pszazelarstwo, 1957, 8, No 9, 230-232

Abstract : The patented preparation called SH which is, apparently, a sodium salt of biochlorphenoxiacetic acid, is widely used in doses of 0.003-0.005 gr per 1 ml of water. When adult bees were experimentally fed with syrup to which SH was added, the above quoted dosages of the preparation proved to be non-toxic for them.--V.A. Kanzyuba
