Tunnel diode circuits (Skhemy na tunnel'nykh diodakh) Moscow, Izd-vo "Energiya", 1965. 78 p. illus. 60,000 copies printed. Series note: Massovaya radiobiblioteka, vyp. 586

TOPIC TAGS: tunnel diode, gallium arsenide tunnel diode, germanium tunnel diode, circuit design

PURPOSE AND COVERAGE: This booklet, intended for advanced radio amateurs, may also be used by technicians and engineers engaged in the design of circuits using semiconductor devices. Principles of tunnel-diode circuit designing are described. Basic parameters and characteristics of tunnel diodes are listed and practical circuit diagrams using these devices are given.

TABLE OF CONTENTS:

- Ch.I. Tunnel Diodes -- 3
- Structure and principle of operation -- 3
- Electrical parameters of a tunnel diode -- 6

NIKOLAYEVSKAYA, M.M.

A rapid method for the determination of the binding sub-
 stance in the electrode case. (I. Novikova and M. M.
 Nikolayevskaya. *Zhurnal Fiz. Khim.* 38, 644-646 (1964).

— Cut the paper from the binder for electrode from the
 side containing 20-70% of volatile substances and 10-25%
 of free C. Add 0.5 g. of the dry substance (the side) to 1
 g. of perch (2 mm. cube) in a 25 cc. vial, mix carefully,
 heat the vial in a water bath at 60°C. for 10 min. to
 (avoiding any oxidation of volatile substances), and for
 2-3 min. with the same substance, then the vial is heated
 with a cover having a 0.5 mm. opening in the upper part
 with the stream flow above the opening of the cover
 (discharge), and in the darkness, and weigh. The mass
 content of the volatile substance and the percentage cover
 of 10 dist. are 0.2 and 1.0%, resp. Note: care
 should not be given that the percentage content of binder
 in the electrode case can be fixed by the content of the
 volatile substance. The mass and the vol. deviations
 from the results were -0.20 and +0.20%, resp.

TITLE: Obtaining unipolar current pulses with 10—100 kamp heights

SOURCE: Pribory i tekhnika eksperimenta, no. 5, 1965, 123-128

TOPIC TAGS: circuit theory, electric resistance, nonlinear effect, electric capacitance, *electric current*

ABSTRACT: Unipolar current pulses are obtained by connecting a capacitor bank with inductive load and nonlinear resistance in series with an electric discharge circuit. The nonlinear resistance depends on the current in a manner given by $R \approx a/|I|^{1-\alpha}$ where, in practice, (e.g., in carborundum products such as tyrite) $0.13 \leq \alpha \leq 0.22$. Analysis of the above circuit leads, after nondimensionalization, to equations

PURPOSE: This book is intended for geographers or cartographers who use topographic maps in connection with their activity.

COVERAGE: This book is a collection of papers given at the Inter-departmental Conference on Topographic Maps called by the Institute of Geography, Academy of Sciences, USSR in 1955. The aim of the conference was to discuss and solve problems in the use of maps and to find means of improving the contents of maps. Included in the papers are discussions of map making methods, contents of Soviet maps, the use of maps for physico-

TITLE: Determination of the Average Velocity of Seismic Waves
in the Carbonate Rocks of the Russian Platform by Com-
bined Use of the Records of Reflected and Refracted
Waves (Opredeleniye sredney skorosti v karbonatnykh
otlozheniyakh Russkoy platformy pri sovmestnom ispol'-
zovanii godografov otrazhennykh i prelomlennykh voln)

PERIODICAL: Razved. i promysl. geofizika, 1955, Nr 14, pp 7-13

ABSTRACT: A method of using different records is proposed for
determining the effective velocity of a layer lying be-
tween a reflecting and a refracting horizon. For this
purpose, the use of direct and reverse records of re-
flected and refracted waves obtained for the same seg-
ment of profile is recommended. It is assumed that the
outer reflecting and refracting surfaces are flat and

itization. New deep seismic sounding data in the region of the Kurile Islands indicate a complex block character of deep crustal structure caused to a greater degree by change of the composition of its rocks than a change of thickness. The velocity of propagation of elastic waves at the M discontinuity in the southern regions is considerably greater than in the region of the underwater Vityaz' Range — 7.8-8.2 km/sec and 7.0-7.2 km/sec respectively. Specialists of the Sakhalin Integrated Scientific Research Institute have formulated a model of the earth's upper mantle with four asthenospheric layers at depths of 65-90, 120-160, 230-300 and 370-430 km, alternating with layers of high strength of matter. The asthenospheric layers are characterized by high absorption of transverse seismic waves, indicating a plasticity of the matter of these layers. The volcanoes of the Kuriles are projected onto the second asthenosphere, which must be regarded as a zone of magma formation. In eastern Kamchatka and in the Kuriles there is a system of faults associated with the continent-ocean boundary zone which extends to a depth of 500 km. The system of faults associated with the trench is traced only to depths of 200-250 km. Orig. art. has: 1 figure. [JPRS: 37,710]

PHASE I BOOK EXPLOITATION

SOV/4171

Burmistrov, Pavel Ivanovich, Konstantin Yevgen'yevich Ivanovskiy, and Georgiy Matveyevich Nibolayevskiy

Pod'yemno-transportnyye mashinostroyeniye (Construction of NIM Hoisting and Transporting Machinery). Moscow, Mashgis, 1966. 93 p. (Series: Sovetskoye mashinostroyeniye v 1959-1965 gg.) 2,500 copies printed.

Ed. of Series: I.I. Changli; Ed.: M.P. Krylov, Engineer; Reviewer: S.A. Kolygin, Engineer; Managing Ed. for Literature on Heavy Machine Building: S.Ya. Golovin, Engineer; Ed. of Publishing House: L.A. Orlova; Tech. Ed.: B.I. Medel'.

PURPOSE: This booklet is intended for the general reader.

COVERAGE: The booklet considers the prospects for the development of hoisting and transportation machinery construction during the years 1959 - 1965, in accordance with the resolution of the XXI Congress of the Communist Party of the Soviet Union. The book discusses the basic trends of technological development of that branch of machinery construction which provides the means of mechanizing,

Title : Low-frequency amplifiers on crystal triodes

Periodical : Radio 8, 44-46, Aug 1955

Abstract : It is stated that crystal triodes are utilized in combination with electronic tubes and in some cases they even assume the role of tubes. The test results of crystal triodes are listed. A simple way is introduced for the stabilization of frequency of the crystal triodes. The various physical processes determining the performance of the crystal triode are discussed. The three basic triode connection diagrams which must be taken into consideration when determining the resistance characteristics in accordance with the triode parameters are shown. Figure, diagram, graphs.

TITLE: High-frequency germanium alloy-diffused p-n-p transistor 1T308

SOURCE: Poluprovodnikovyye pribory i ikh primeneniye; sbornik statey, no. 13, 1965, 86-100

TOPIC TAGS: germanium transistor, HF transistor, alloy diffused pnp transistor,

flip flop circuit/1T308 transistor

ABSTRACT: The basic manufacturing processes and design characteristics of a new germanium alloy-diffused transistor of the 1T308 type are described. In the final p-n-p structure of the transistor, germanium acts as the collector, the thin n-layer as the active base, and the recrystallized p-layer as the emitter. The transistor, which possesses highly stable characteristics against external mechanical and climatic effects, has the following basic parameters: maximum permissible dissipated power, 150 mw; maximum collector (emitter) current, 50 mamp; collector capacitance, 8 puf; collector time constant, 500 nanosec; and maximum collector-emitter voltage, 12 v. The 1T308 transistor is designed as a pulsed device which can operate on large signals in saturating flip-flop circuits, blocking-generators, relays, and logical and memory elements. It can also be used both as a high-frequency amplifier, a generator of harmonic oscillations of small and large signals, and as an element operating in

TITLE: Low-temperature parameters of transistors 5-4

SOURCE: Poluprovodnikovyye pribory i ikh primeneniye; sbornik statey, no. 14, 1965. 3-19

TOPIC TAGS: germanium, transistor, parameter

ABSTRACT: Theoretical and experimental data regarding current amplification and input and output impedance of various types of the transistors in the low-temperature range are considered. An experimental liquid nitrogen refrigeration chamber is described; this chamber keeps the temperature of the medium within the low temperature range, down to -190C, with deviations not exceeding 1 C. The aim of the study was to fill the existing gap in the theoretical and experimental data on the low-frequency operation of germanium transistors in the low-temperature range down to -180C. Graphs and data presented in the original article on temperature dependences of transistor electric parameters are based on measurement results from 10-14 transistors of each type tested. Orig. art. has: 14 figures, 1 table, and 23 formulas. [KF]

Statement of progress of animals by chemical analysis
 of hair. I. - *Chemical analysis of hair*. *Chemistry* 1928,
 No. 4-5, 27. *Lab. Publ. (U. S. S. R.)* 24, No. 9, 54, 24 &
 (1928). - The method is based on the fact that female hair
 regrows less than male hair, but the amt. of S in hair in-
 creases considerably during pregnancy. Table 2 or 4 hair
 with roots from any part of the animal skin, wash with hot
 water or ether, dry, cut off the roots and analyze them.
 Add to 0.1 g. of hair cut hair in a dry 25-cc. test tube 1 cc.
 of a 10% soln. of HClO₄. Heat for 1-2 hrs. until the hair
 forms a gelatinous mass and the liquid is of a moderate
 brownish color. Add 1 cc. of dist. water, bring the tube
 to boiling, and add 10 cc. of water. Shake vigorously and
 pour 1 cc. of the liquid into a test tube. Add 1 drop of a
 1% soln. of methylred blue (in 50% alc.) and 7 drops of 1%
 HClO₄, and then shake the mixt. well several times. The
 appearance of the blue color is observed after 10-15 sec.
 if the hair is from pregnant animals and only after 2-3
 min. if from pregnant animals. This reaction gives an
 accuracy of 0.1%.
