"Changes in the Suprarenal Cortex in Irradiated and Pharmacologically Protected Rats"

Sofia, Doklady Bolgarskoy Akademii Nauk, Vol 19, No 7, 1966, pp 677-680

Abstract: [English article] The suprarenal cortex is an important factor in the development of irradiation injuries in view of its great significance in the general resistive power of the organism and of its considerable sensitivity to ionizing effects. The function of the suprarenal cortex in albino rats was determined from a number of indices, some of them of an indirect character. The experiments were carried out on 176 animals of both sexes with initial body weight of 120-160 g. The conditions of irradiation were as follows: 180 kV, 20 mA, filter 0.5 mm Cu, H 40 cm, dose strength 112.7 r/min. Thirty-seven of the 40 radioprotected rats (80.4%) remained alive on the 90th day after irradiation. At that time the animals were in good condition and some of them even had progeny. An analysis of the results shows that roentgen irradiation with 800 r causes changes in the functional condition of the suprarenal cortex of albino rats, namely, an increase at the height of the disease and inhibition before death. Besides that, contradictory changes are observed in the biochemical indices (K/Na, ascorbic acid, 17-KS,

ABSTRACT : In view of the low absorption of the dye from the dye bath, the use of low values of the vat modulus (recirculation ratio) (e.g., 5-5 : 1) and reuse of the spent solutions at temperatures of 20-30° is recommended. The oxidation of the dye should be carried out with minimal amounts of NaNO<sub>3</sub> (less than 1 gm per liter), added to the dye bath, with subsequent passage of the yarn through a solution of H<sub>2</sub>SO<sub>4</sub> (20 ml/liter). The colors obtained are characterized by excellent

TITLE: Quantitative interpretation of chromatograms in the gas chromatography<sup>1</sup>  
analysis of gas mixtures

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 10, 1965, 939-942

TOPIC TAGS: gas chromatography, quantitative analysis

ABSTRACT: The method of internal normalization with correction factors can be applied to the quantitative interpretation of differential chromatograms obtained during the analysis of gas mixtures with a component identical to the carrier gas (CICO) (K. Kaishev, R. Nikolov, S. Koleva, Compt. rend. Acad. bulg. Sci., 17, 1964, No 12, 141). Owing to the absence of a peak corresponding to CICO, the interpretation of such chromatograms is possible after the density of their corresponding gas mixtures has been experimentally determined. In the present article, the author derives a series of functional relationships which permit a rigorous evaluation of the CICO concentration limits and leads to a satisfactory level of accuracy of the above mentioned approach. A subsequent paper based on extensive experimental material will illustrate these relationships and indicate the potentialities of the method. This paper was presented by Academician D. Ivanov on 12 July 1965. Orig. art. has: 15 formulas. [Orig. art. in Eng.]

TITLE: Formulae and nomograms for calculations on U-shaped (expansion) compensators (for pipes). (Formuly i nomogrammy dlya rascheta U-obraznykh kompensatorov)

PERIODICAL: Teploenergetika, 1958, No. 7, pp. 89-92 (USSR)

ABSTRACT: Axial stresses set up in pipework by temperature and pressure cause dangerous stresses therein and also act upon the fixed supports. These stresses and forces may be reduced by the use of U-shaped pipework compensators. Formulae are given for calculating the stresses in compensators, and the forces at supports. The main difficulty in making the calculations is to determine the geometrical parameters of the referred axis of the pipework. Formulae applicable to a U-shaped bend are then offered; they are claimed to be accurate and universal in respect of both compensator shape and pipe dimensions. To facilitate the calculations, nomograms derived from the formulae are drawn in Figs. 2. & 3. These may be used to determine forces at the supports and stresses in the compensator pipe. Correction factors that are sometimes necessary are provided in Table.1. The data in Table.2. shows that, for the

Card 1/2

SOV/94-58-7-20/22

Formulae and nomograms for calculations on U-shaped (expansion, compensators (for pipes)

cases considered, the nomograms overestimate the stresses in the pipe by 5 - 17%. A formula is then written for the permissible bending stress in pipes, and corresponding graphs are given in Fig.4. There are 4 figures, 2 tables and 3 literature references (Soviet).

Effect of low-frequency ultrasound on the coagulation properties of human serum

Author: M. Ilyasova & S. Saitariya, Nov. 5, 1964, 191-192

Abstract: Ultrasound, blood coagulation, fibrinogen, serum

Blood serum obtained from healthy subjects was placed in a glass jar and left overnight at room temperature. The next morning, the serum was centrifuged at 3000 rpm for 15 minutes. The supernatant was discarded and the remaining clot was washed three times with 0.9% NaCl solution. The clot was then suspended in 0.9% NaCl solution and sonicated at 20°C for 10 minutes. The clot was then washed again with 0.9% NaCl solution and sonicated for another 10 minutes. This process was repeated three times. The final clot was then washed with 0.9% NaCl solution and sonicated for a final time. The clot was then washed again with 0.9% NaCl solution and sonicated for a final time.

The clot was then washed again with 0.9% NaCl solution and sonicated for a final time. The clot was then washed again with 0.9% NaCl solution and sonicated for a final time.

Card 1/2

1-236-45  
COLLECTION NR: AP5013470

The invariably lower than normal viscosity of sera between the mean viscosity of heated sera and the control, is significant. The viscosity of sera exposed to ultrasound was more resistant to high temperature. The change in decreased viscosity of heated sera parallel the changes in times of coagulation of sera exposed to ultrasonic waves which, as noted above, was lengthened. The viscosity of sera exposed to ultrasonic waves which, as noted above, was lengthened, suggests that the method of preparation of the serum and of proteins may reveal latent changes after a short time of exposure to ultrasonic waves. St. NIKOLOV, Department of Propedeutics in Internal Medicine (Katedra za propedeutika na vnutreshnite bolezni) Head (rukovoditel) Prof Iv. IONKOV, Medical College (VMI [Vissht-meditsinski Institut]) Sofia.

"Thromboembolic Diseases."

Sofia, Suvremenna Meditsina, Vol 13, No 11, 1962; pp 50-55.

Abstract [English summary modified]: Essentially a review of the literature of the last 15 years or so, discussing the physiological background of blood coagulation and the pathogenesis of thrombosis and embolic formations; diagnostic methods, preventive measures and treatment are all reviewed briefly. Ten Soviet and 20 Western references.
