Detskiy mashin (Machine Parts) Blansk, Red. 114, 1941 871 Lenin I.V. Stalina, 1949.
69 p. (Series: Ita: Shomak nachayab truder, 777. 75) 1,520 copies printed.

Sponsoring Agencies: Ministerstvo vyzhago, strokoo spetsial'nyy i professional'-
nyy otkrovalnye KZR; Belorusskiy politimishinskiy Institut I.V. Stalina.

Editorial Board: V.I. Tretyak (Resp. Ed., Doctor of Technical Sciences, Professor;
V.I. Brikharich, Candidate of Technical Sciences, Docent; L.M. Ruberovskiy,
Candidate of Technical Sciences, Docent, and A.I. Zhelokov, Candidate of
Technical Sciences, Docent; Resp. Ed. for this vol.: A.A. Muzhin, Engineer;
Ed.: B. Kopylov; Tekh. Ed.: Ye. Koshchik.

REMARKS: This collection of articles is intended for technical personnel and
scientific writers.

CONTENTS: This is the 75th issue of a series published by the Belorussian Poly-
technic Institute I.V. Stalin. The collection contains eleven articles,
ten of which are devoted to studies and work related to the life of certain
machine parts. The remaining article deals with the power of the lighting
installation in a cinematographic apparatus. No personalities are mentioned.
References accompany most of the articles. There are 32 references; 30 Soviet,
1 English and 1 German. A short appendix is also included.

TITLE: A Simplified Theory of the Accuracy¹⁴ of Mechanisms

PERIODICAL: Sb. nauchn. pabot. Belorussk. politekhn. in-t, 1959, No. 65,
pp. 141-156¹⁷

TEXT: A procedure is presented for analyzing the primary errors in the elements of kinematic pairs and for determining their influence on the error in the position of the mechanism. The coordinates of the relative position of the pair elements are represented by the known mode as two vectors (for the translational shift and the rotation), and, on this basis, the logical symbolism of various kinematic pairs is given. The characteristic of a member of the mechanism is determined as the product of three pairs of vectors, whereby the third vector pair represents the influence of the error in the rotation of the preceding element on the error in the translational shift of the following element of the pair. For two-dimensional mechanisms, the intersection lines of these surfaces are considered as pair elements, which form the pair element with the

Leja, F., et Opial, Z. Un lemme sur les polynômes de Lagrange. Ann. Polon. Math. 2 (1955), 73-76. 2
1 - F/W
On donne une suite triangulaire de nombres complexes

$\zeta_j^{(n)}, 0 \leq j \leq n, \zeta_j^{(n)} \neq \zeta_k^{(n)}$ pour $j \neq k$, admettant z_0 pour point d'accumulation. Soit $L_n^{(n)}(z)$ le polynôme de degré n égal sur $\zeta_j^{(n)}$ à 0 ou 1 suivant que $j \neq k$ ou $j = k$. Soit $M_n(r_0, r) = \max \{ |L_n^{(n)}(z_0)| \}$ pour $|\zeta_j^{(n)} - z_0| < r$. On a quel que soit $r > 0, \limsup (M_n(r_0, r))^{1/n} \geq 1$ ($n \rightarrow \infty$). D'ailleurs, on peut choisir $\{\zeta_j^{(n)}\}, z_0$ et r de façon que cette \limsup prenne une valeur arbitraire ≥ 1 . J. P. Kahane.

OPIAL, Z.

2
1-F/W

Opiál, Z. Sur un système d'inégalités intégrales, Ann. Polon. Math. 3 (1957), 200-209.

Consider the system (1) $y_i' = f_i(x, y_1, \dots, y_n)$ ($i=1, 2, \dots, n$) with f_i defined and continuous on some open set $\Omega \subset \mathbb{R} \times \mathbb{R}^n$. Let $P = (\xi, \eta_1, \dots, \eta_n) \in \Omega$ and let $\varphi_i(x)$ ($i=1, 2, \dots, n$) be continuous functions which satisfy on some $I_\alpha = [\xi, \xi + \alpha]$, $\alpha > 0$, the inequalities

$$(2) \varphi_i(x) \leq \eta_i + \int_{\xi}^x f_i(t, \varphi_1(t), \dots, \varphi_n(t)) dt \quad (i=1, 2, \dots, n).$$

First, the author proves this generalization of a theorem of Viswanatham [Proc. Indian Acad. Sci., Sect. A. 36 (1952), 335-341]: If each f_i is non-decreasing on Ω , i.e., if $(x, a_1, \dots, a_n), (x, b_1, \dots, b_n) \in \Omega$ and $a_k \leq b_k$ ($k=1, 2, \dots, n$) imply $f_i(x, a_1, \dots, a_n) \leq f_i(x, b_1, \dots, b_n)$ for each i , then the functions φ_i satisfying (2) also satisfy $\varphi_i(x) \leq \psi_i(x)$ ($i=1, 2, \dots, n$) on $I_\alpha \cap I_\beta$, where $\psi_1(x), \dots, \psi_n(x)$ is a solution of (1) through P which is maximal on some $I_\beta = [\xi, \xi + \beta]$, $\beta > 0$. The existence of such a solution $\psi_i(x)$ ($i=1, 2, \dots, n$) of (1) follows from a theorem of Ważewski [Ann. Soc. Polon. Math. 23 (1950), 112-166; MR 12, 705].

Next, the author proves the following theorem. If for

1/2

Op' 2, 2

2

1-FW

every $P \in \Omega$ and every set $\varphi_i(x)$ ($i=1, 2, \dots, n$) of continuous functions satisfying (2) on some I_α there exists a $\delta > 0$ and a solution $y_i(x)$ ($i=1, 2, \dots, n$) of (1) through P such that $\varphi_i(x) \leq y_i(x)$ on $[\xi, \xi + \delta]$, then each f_i is locally non-decreasing with respect to each y_k ($k \neq i$) separately, and non-decreasing with respect to y_i in a sufficiently small neighborhood of every point in Ω . Finally, the author

gives a complete description of how a set $\varphi_i(x)$ ($i=1, 2, \dots, n$) of continuous functions can be constructed explicitly so as to satisfy (2) on some I_α .

H. A. Antosiewicz (Providence, R.I.)

SMW

Opial, Z.

Opial, Z. Sur une famille de fonctions analytiques. Ann. Polon. Math. 3 (1957), 312-318.

1-FW

Let C denote family of functions f which are analytic in the unit disk K and for which (1) $\int_K \ln^+ |f(z)| d\sigma < \infty$. The example $\exp(1-z)^{-1}$ shows that Nevanlinna's class A is a proper subset of C . If $f \in C$ has the zeros a_j in K , and if $f \neq 0$, then $\sum (1-|a_j|)^2 < \infty$. Any subclass of functions in C for which the integral in (1) is uniformly bounded is a normal family. This conclusion holds also if in (1) the unit disk is replaced by an arbitrary domain D , and the operator \ln^+ by an operator ϕ such that $\phi(|f(z)|)$ is real, nonnegative, continuous and subharmonic in D whenever f is analytic in D , and unbounded if f is unbounded.

 C111/C444

On the asymptotic behaviour...

$$X' = F(t, X) + G(t, X), \quad (3)$$

where $G(t, X)$ is defined and continuous in X , the following theorems:
 1.) If $V(X)$ satisfies the conditions (1), (2), and the inequality
 $|G(t, X) \text{grad} V(X)| \leq p(t, V(X))$, where $p(t, u)$ is a continuous non-
 negative function of t , and $u \geq 0$, and if all solutions of the equation
 $u' = p(t, u)$ are bounded for $t \geq 0$, then every solution $X(t)$ of (3)
 which is defined for $t \geq 0$, is bounded in the interval $(t_0, +\infty)$. J

2.) Let $V(X)$ satisfy (1), (2), and the inequality $|G(t, X) \text{grad} V(X)| \leq p(t) \phi(V(X))$, where the positive continuous functions $p(t)$ and $\phi(u)$ are such that

$$\int_0^{\infty} p(t) dt < +\infty, \quad \int_1^{\infty} \frac{du}{\phi(u)} = +\infty, \quad (4)$$

Then each of the solutions $X(t)$ of (3) which is defined for $t \geq 0$, is bounded in $(t_0, +\infty)$.

3.) Let $G(t, X)$ not depend on X , and let

$$\int_0^{\infty} |G(t)| dt < +\infty.$$

Card 2/3

On the asymptotic behaviour...

S/044/62/000/004/026/099
0111/C444

If $V(X)$ satisfies (1), (2), and the inequality $|\text{grad}V(X)| \leq \rho(V(X))$, where the continuous positive function $\rho(u)$ satisfies the condition (4), then every solution $X(t)$ of the system (3) which is defined for $t_0 \geq 0$, is bounded in $(t_0, +\infty)$.

The second part is dedicated to the investigation of the boundedness of the solutions of the systems

$$X'' = f(t, X, X') + g(t, X, X'), \quad (5)$$

where $f(t, X, X')$ and $g(t, X, X')$ are defined and continuous in the space $F = I \times E \times E$; analogous theorems are proved.

AUTHORS: Lasota, A., Opial, Z.

TITLE: Interpolation problem for a differential equation of the
n-th order

PERIODICAL: Referativnyy zhurnal. Matematika, no. 10, 1962, 39, abstract
10B164 (Bull. Acad. polon. sci. Sér. sci. math., astron. et
phys., v. 9, no. 9, 1961, 667 - 671 [French; summary in Rus.])

TEXT: For the n-th-order differential equation

$$x^{(n)} = f(t, x, x', \dots, x^{(n-1)}), \quad (1)$$

the following problem of interpolation is posed: assuming n points
 $(t_1, c_1), \dots, (t_n, c_n)$ ($t_1 < t_2 < \dots < t_n$) find a solution $x(t)$ to the equa-
tion (1), which satisfies the conditions

$$x(t_i) = c_i \quad (i = 1, 2, \dots, n). \quad (2)$$

Interpolation problem for a...

If the function $f(t, x_0, \dots, x_{n-1})$ fulfills a Lipschitz condition

$$|f(t, x_0, \dots, x_{n-1}) - f(t, \bar{x}_0, \dots, \bar{x}_{n-1})| \leq \sum_{i=0}^{n-1} L_i |x_i - \bar{x}_i|,$$

the following theorem of uniqueness is valid: in consequence of the problem (1) - (2) having not more than one solution, it is sufficient that each function $x(t)$ satisfying the differential inequality

$$\dot{x}^{(n)}(t) \leq \sum_{i=0}^{n-1} L_i x^{(i)}(t); \quad (3)$$

and the conditions $x(t_1) = 0$ ($i = 1, \dots, n$) be identically equal to zero.

The same condition is shown to be sufficient for the existence of at least one solution, because the following theorem is valid: Let

$f(t, x_0, \dots, x_{n-1})$ be a continuous function on the set $a < t < b, -\infty < x_i < +\infty$ ($i = 0, 1, \dots, n-1$), which fulfills the inequality

$$|f(t, x_0, \dots, x_{n-1})| \leq M + \sum_{i=0}^{n-1} L_i |x_i| \quad (M \geq 0, L_i > 0). \quad (4)$$

Card 2/3

Interpolation problem for a...

S/044/62/000/010/005/042
B112/B102

If, for any numbers $t_1 < t_2 < \dots < t_n$ of the interval (a, b) , the function $x(t) = 0$ is the unique solution of the inequality (3) which fulfills the condition $x(t_i) = 0$ ($i = 1, \dots, n$), then there is at least one solution of the problem (1) - (2). The relevant theorem is proved for the linear case, and the general case is reduced to linear by effecting a certain transformation in the form of the equation. A transformation T of the functional space E containing the functions of the class $C^{n-1}[c, d]$ with

the norm $\|x(t)\| = \sup_{[c, d]} \sum_{i=0}^{n-1} |x^{(i)}(t)|$, where $a < c < t_1 < \dots < t_n < d < b$, is

introduced. It is proved that this transformation is continuous and that the set $T(E)$ is compact in E . Therefore, a fixpoint of the transformation T exists according to Schauder's theorem. From this follows the theorem mentioned above. [Abstracter's note: Complete translation.]

TITLE: On an almost-periodic differential equation without almost-periodic solutions

PERIODICAL: Referativnyy zhurnal, Matematika, no. 12, 1962, 40, abstract 12B182
(Bull. Acad. polon. sci. Sér. sci. math., astron. et phys., 1961, v. 9, no. 9, 673 - 676; French; summary in Russian)

TEXT: For a differential equation of the first order $dy/dx = g(x, y)$, (1) where $g(x, y)$ is a continuous function, Masserat has demonstrated that, if the equation (1) admits of a solution bounded on the axis $-\infty < x < \infty$ and its right-hand member is periodic in x , then that equation has at least one aperiodic solution. The analogous proposition for system (1) with a right-hand member almost-periodic in x turned out to be false. The author cites an example of an equation of form (1) with a right-hand member almost-periodic in x all of whose solutions are bounded for $-\infty < x < +\infty$, but none of which is almost-periodic in x . To construct the example, the author uses a singular case of the Poincaré distribution

The physiological economy of milk production. Mojmir Opichal (Vysoká škola zem., Brno, Czech.). *Sborník Českoslo. Akad. Zvěstování* 21, 370-04(1948)(Pub. 1948) — The consumption of protein per 1 kg of milk was studied: (1) The fat percentage of milk increased from 2.4% to 7.0% while the milk quantity remained constant. (2) The quantity of milk increased per year from 1,000 kg to 7,000-10,000 kg, while the fat percentage decreased in regression $R \frac{\text{quantity of milk}}{\text{fat percentage}} = +0.000, -0.00005$, and -0.0002 . (3) The percentage of protein in milk in (1) and (2) is changed according to the fat percentage of milk in regressions $R \frac{\text{fat percentage}}{\text{protein}} = +0.000, +0.3, +0.0$, and $+1.0$. The consumption of protein for 1 kg of milk increases linearly, if the fat percentage is increased and the quantity of milk remains constant. The increase of protein consumption is the higher, the higher is the regression of protein to the fat percentage. The protein consumption per 1 kg of milk decreases curvilinearly with increasing milk quantity. The decrease of protein consumption is the larger, the higher is the regression of protein to fat percentage and the higher is the negative regression of fat percentage to the quantity of milk.

Abs Jour: Ref Zhur-Biol., No 3, 1958, 12033

Abstract: deficient in animal protein, intended for chickens aged up to 4 weeks, this deficiency was made up by adding procaine penicillin and chlortetracycline separately or jointly to the rations. The absence of these antibiotics in the feeds, as well as the addition of streptomycin, was causing a decrease in the weight of chickens. At 8 weeks, deficiency in animal protein was remedied only by penicillin and had no influence upon the weight of chickens. Likewise, at 11 weeks, penicillin alone was making up for the deficiency of animal protein. The action of streptomycin and chlortetracycline was not precisely ascertained. The results obtained also show that the addition of animal protein to the feed of chickens over 4 weeks old is not a requisite. Antibiotics did not affect the meat qualities of the

The mechanism of glucose metabolism by *Escherichia coli*. J. Chęcińska-Blaż, M. Kanski, and U. Stubińska (Inst. M. C. S., Lublin, Poland). *Ann. Univ. Mariae Curie-Skłodowska, Lublin, Poland, Sect. D*, 4, 69-113 (1940). Expts. with cell powders and exts. do not give a true picture of the metabolism *in vivo*, according to the authors. Only investigations using living cells should be used for this purpose. Such studies show that inorg. P_4O_{10} and K^+ are essential for normal growth and glucose metabolism. P_4O_{10} can not be replaced by adenosine triphosphate or acetylphosphate. In phosphorylation reactions in the cell, I can be found in the medium during optimum cell growth, but not when glycolysis rate is high. The absence of Mg^{++} from the medium causes partial inhibition of growth and glucose breakdown. Bacterial growth only is inhibited by NaF and indoleacetic acid, while dinitrophenol, β -naphthylamine, Na₂SO₃, arsenite, CH₃CHO, phlorizin, and malonate inhibit glycolysis more than growth. In the presence of Na arsenate and Cu⁺⁺, no glycolysis can take place, but the former also affects the cell growth while the latter does not. Complete inhibition of both processes is achieved with KCN, Na₂N₂, and NH₂OH-HCl. Insulin catalyzes the glycolytic reactions, while nicotinamide, yeast exts., cozymase, and thiamine-HCl show no effect. It is suggested that glucose is used through 2-3 different paths and that the Embden-Meyerhoff scheme cannot be applied to *E. coli* metabolic mechanism without

some minor changes. Standard methods for glucose phosphate, pH and bacterial growth detn. are used. I. Z. Roberts

J. Effect of selenite on growth and glucose metabolism in fluid cultures of *Escherichia coli*. J. Opieńska-Blauth and H. Iwanowski (*Acta microbiol. polon.*, 1953, 4, 273-280). The effect of various concn. of selenites on *E. coli* cultures is studied at 37°. The reduction of selenites to Se can be noticed already after a few hr. of incubation, and selenites begin to exert a toxic influence on *E. coli* in concn. $> 1 \times 10^{-4}$ M Se. The inhibition of glucose metabolism is quite marked and the amount of it, as determined by paper chromatography method, remains almost unchanged. The enzymic processes blocked by selenites can be reactivated by cysteine or histidine. The addition of SO_4^{2-} does not reverse the selenite-blockade which is also not influenced by the presence of Mg. S. K. Achowicz

OPIEJSKA-BLAUTH, J.

Substance giving positive Voges-Proskauer's test in fluid cultures of *Escherichia coli* in presence of some enzyme inhibitors. J. Opiejska-Blauth, T. Borkowski and J. Biadecka-Borkowska (*Acta microbiologica*, 1953, 8, 263-276).—The accumulation of an unidentified reducing substance [X] in cultures of *E. coli* in the presence of 0.0025 M-iodoacetic acid was much greater when pantothenic acid or β -alanine was added to the medium. X only appeared when the pH of the medium was 4.0-7.0; it was present inside bacterial cells. It was not identical with any compound known as an intermediate in glucose metabolism in *E. coli*. The relation of X to acetoin was indicated by its positive Voges-Proskauer reaction. A similar reducing substance having an R_f value identical with that of X was detected in sour milk. X is not identical with acetoin and is probably a precursor. Accumulation of X results from the action of many enzyme inhibitors e.g. iodoacetic acid, selenite, and 8-hydroxyquinoline. X cannot be utilized as a carbon source by *E. coli*.

POL.

A comparison of chemical indexes of early stages of plumbism in workers from the Lublin (Poland) District exposed to lead poisoning. Janina Opieńska-Blauth, Alfred Tuszkiewicz, and Jan ~~...~~ *Mariae Chris-Skladowicz, Lublin-Poloniu, Sect. D, 8, pp. 161-64 (1953) (English summary).*—About 100 workers were used in this study. They were potters who were employed at enameling earthenware, typographic workers, storage-battery workers, electricians, workers in canned-meat factories, and workers in gasoline stores. Urinary and blood lead levels were established as well as porphyrin tests performed. The dibizone colorimetric method was used for the lead detns. Raised urinary and blood lead levels and pos. porphyrin tests preceded clinical symptoms of lead poisoning. Longer breaks in the ingestion of lead markedly favor a decrease of lead in blood and urine. No answer can be given as to whether blood or urine lead detns. are of greater value in early lead poisoning. It seemed though that in the initial stages of the worker's contact with lead higher contents of lead occur more often in urine; this was not observed when the period of work was extended over many years. Among the different groups of workers examined, the highest chem. indexes of lead poisoning were found in potters and workers in canned-meat factories.
