TITLE: Using the composite rotors in gas-turbine construction

SOURCE: Energomashinostroyeniye, no. 5, 1963, 36-38

TOPIC TAGS: composite turbine rotor EI572 steel 34KhN3MF steel austenite-pearlite weld

ABSTRACT: An experimental investigation of strength of the welded joint between the austenitic (EI572 steel) disk of gas turbine and the pearlitic (34KhN3MF steel) shaft of axial compressor is reported. Dynamic and thermal stresses were determined on a nonrotating experimental rotor about 3 m long which was an adequate copy of the actual rotor. Candidate of technical sciences V. N. Zemzin and Engineer A. S. Saldatova were responsible for the building and checking of the experimental rotor. The dynamic-test resonant vibrations represented 4,300 rpm and 7,200 rpm. The rotor was also tested for 107-cps vibrations with a bending-stress amplitude in the weld of plus-minus 140 kg cm⁻² for 48 hours. M. N. Sokolova, Engineer of Otdel issledovaniya metallou, TsKTI (Metal Investigation Division, TsKTI), determined the linear-expansion coefficients of austenitic and pearlitic steels. Thermal stresses were measured at about 120°C with a proper distribution of the

64

temperature gradient. Finally, the residual (internal) stresses near the weld were determined. The investigation permitted to accept the composite rotors for experimental operation at an industrial plant. Orig. art. has: 1 formula, 5 figures, and 1 table.

TITLE: The Effect of Electrical Pre-History of Electro-Phosphor on the
Characteristics of its Emission when Excited with Short Voltage Pulses.

PERIODICAL: Optika i spektroskopiya, 1959, Vol 7, Nr 3, pp 398-406 (USSR)

ABSTRACT: The paper reports the results of an experimental study of the dependence of the emission characteristics of an electro-phosphor on parameters of the electric field which has acted on the phosphor before the particular moment considered. The phosphor was excited with square voltage pulses from a special generator shown schematically in Fig 1. This generator consisted of four parallel circuits and had two outputs by means of which several independently controlled series of pulses could be produced. A photomultiplier FEU-19 was used as the receiver of electroluminescence. Two wide-band oscillographs were used: one to record the voltage pulses and the other the corresponding light pulses. Phosphors of ZnS-Cu(Pb,Cl) and ZnS-Cu,Cl types were used. They were placed together with a solid organic dielectric (total thickness 30-100 μ) between the plates of a capacitor. One of these plates was made of transparent conducting glass and the other was a layer of

Card 1/4

SOV/51-7-3-16/21

The Effect of Electrical Pre-History of Electro-Phosphor on the Characteristics of its Emission when Excited with Short Voltage Pulses

aluminium. The capacitance of the combined layer was about 100 pF/cm^2 . In this paper the authors used the term "brightness" in the sense of the magnitude of the electric signal at the photomultiplier, which was proportional to the light flux reaching the photo-cathode of the multiplier. When the phosphor was excited with consecutive voltage pulses of the same amplitude, polarity and period, a light pulse was observed corresponding to each voltage pulse. Each light pulse was found to consist of two peaks: a "front" peak occurring at the moment of the voltage rise and a "rear" peak corresponding to the fall of voltage (Fig 2). The ratio of the heights of the two light peaks was found to depend strongly on the period of the exciting voltage pulses and on temperature. When voltage pulses of 10 sec repetition period were used the "front" peak practically disappeared (Figs 3-5). It also disappeared when temperature was raised to $70\text{-}100^\circ\text{C}$ (Fig 6). The higher the phosphor temperature, the faster the decrease of the "front" peak amplitude with increase of the voltage pulse repetition period (Fig 7). The pulse generator of Fig 1 was also used to apply three series of pulses (Fig 8, simultaneously or in pairs. These combinations of pulses were used for a more detailed study of the nature of the light pulse. The results are

Card 2/4

Effect of Electrical Pre-History of Electro-Phosphor on the Characteristics of
Luminescence when Excited with Short Voltage Pulses**

shown in Figs 9-17. From general considerations of electroluminescence of polycrystalline phosphors (Refs 12, 13) and from the experimental data mentioned above, the authors deduced the following explanation of the "appearance of two peaks in the light pulses. At the moment of application of the first voltage pulse the strong field produced in a small excitation region transfers liberated electrons from this region into a non-excited portion of the crystal or to the surface of a grain which is directed towards the positive electrode. Such electrons are captured by shallow or deep capture levels and by "radiationless transition centres" or they escape to the positive electrode. When the field is removed (the tail end of the voltage pulse), the field produced by the positive space charge in the excitation region acts on the crystal. Electrons which are then in the conduction zone return rapidly under the action of the space-charge field into the excitation region and recombine with ionized emission centres. In this way the "rear" peak of the light pulse is produced. Some electrons liberated on excitation cannot return during this period, e.g. electrons at deep capture levels or those trapped by "radiationless transition centres". Consequently,

TITLE: Geology and Potentialities of the Southern Ural Brown-Coal Basin (Geologiya i perspektivy Yuzhnoural'skogo burougol'nogo basseyna)

PERIODICAL: Tr. Labor. geol. uglya AN SSSR, 1956, Nr 6, pp 438-453

ABSTRACT: The Southern Ural brown-coal extends along the western foothills of the Southern Urals. The substratum below the Tertiary coal-bearing beds consists of Permian and Lower Triassic rocks [Sakmaro-Artinskiy, Kungurskiye, Ufimskiye, Lower and Upper Kazanskiye, Tatarskiye, and Vetluzhskiye sediments.] Almost all the horizons of the Mesozoic and Cenozoic show signs of coal. Upper Triassic deposits contain black jet-lignite and uneconomic, thin (3.35 m) layers of coal (cuticular durain). Jurassic rocks range up to 100 to 200 m thick and contain thin (0.1 to 0.8 m occasionally up to 8 m) high-ash

TITLE: Problem of the principles of compilation of geochemical maps
during a geological survey

SOURCE: Sovetskaya geologiya, no. 6, 1966, 90-100

TOPIC TAGS: geochemistry, geologic survey

ABSTRACT:

Since the principal scale of geological mapping in the USSR is 1:50,000, it follows that this should be the main scale for geochemical mapping. This paper is a detailed presentation of a method used in compiling geochemical maps at this scale simultaneously with geological field work. The study is based on work done in an unforested area in Kazakhstan with good exposure of surface rocks -- an area of complex geological structure with ore shows. The article is significant due to the detail with which it describes all stages in map compilation, from preparations for field work to preparation of the final map and the method could be used for other regions of comparable characteristics. The principles of such work are described, followed by comments on the

Card 1/2

UDC: 550.84:528.912

0936 1384

ACC NR: AP7004555

field work method and step-by-step description of the statistical processing of data and map plotting. The final geochemical map is used together with cross sections and a histogram which accompanies it and in combination with a map of the structural geology of the same quadrangle. The map can serve as a basis for predicting the occurrence of ore deposits or indicating areas promising for prospecting work. When this work is done simultaneously with a geological survey, the cost of the latter is increased by approximately 20-30%. Orig. art. has: 1 figure.

TITLE: A turborefrigerator. Class 17, No. 187050

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 20, 1966, 44

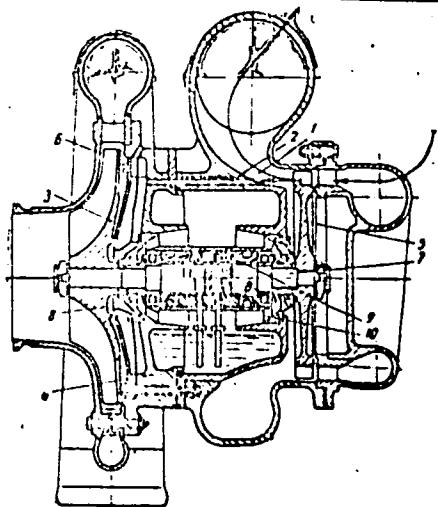

TOPIC TAGS: refrigeration equipment, turbine, ventilation fan

ABSTRACT: This Author's Certificate introduces a turborefrigerator for pressurized cabins and instrument sections of aircraft. The installation contains a housing, turbine and blower all mounted on a shaft set in air-cooled ball bearings. The unit is designed for improved cooling and reduced weight. Longitudinal cooled air supply channels are made in the housing at the level of the turbine blade base. These channels communicate with the cavity between the screen and the cover. The shaft bearings are mounted on the ends of a thin walled housing with reinforced flanges which have sloping holes for coolant circulation.

TITLE: A device for lubricating bearing junctions. Class 47, No. 180924

SOURCE: Izobreteniya, promyshlennyye obraztay, tovarnyye znaki, no. 8, 1966, 120

TOPIC TAGS: lubricating oil, lubrication, lubrication technique, ANTI-FRICTION

BEARING

ABSTRACT: This Author Certificate presents a device for lubricating bearing junctions. The device contains an oil bath, and a wick holder with a wick feeding the oil to a shaft held in the bearings (see Fig. 1). To prevent singeing the wick and dropping its remnants into the bearings, a separating contact element is placed between the shaft and the wick. This element is made of antifrictional heat-resistant material and contains axial capillary ducts. Grooves running on the surface of the contact element at an angle to the shaft axis are connected to the ducts and touch the shaft.

TITLE: Production Line Docks

PERIODICAL: Grazhdanskaya Aviatsiya, 1960, No. 6, p. 6.

TEXT: The authors describe a mobile repair dock for M.L - 14 (Il-14) aircraft designed by the plant collective under the supervision of I. Ivasik. The dock is made of welded channel-steel and resembles a trolley-frame on rails along which the aircraft is moved as shown in the figure. The aircraft is suspended inside the dock and repairs are carried out from a number of bridging boards. The dock has two fitter's benches, compressed air is supplied from the main line and a 24 v electric power supply is maintained. Upon a number of tests and modifications the production of these docks has been entrusted to the establishment supervised by A. Ovssyanikov. The photograph shows the fitter V. Makhov of the repair workshop supervised by Kh. Izmiryan working on the landing gear of a Tu-104 aircraft. There is 1 photograph and 1 figure.

Title : Certain Methods of Fattening Pigs.

Orig Pub : Zhivotnovodstvo, 1957, No 5, 14-21

Abstract : At the Yaroslav experimental station for animal husbandry, it was determined that the cross-breeding of the Breytovskaya, Large White and Livenskaya breed of pigs increases the fertility of the sows (by 1-2 pigs in the litter), the live weight of the pigs at birth (100-200 grams per head), increases the fattening period (by 10-20 days) and justifies the expenses of the feed (by 0.3-0.6 food units). Suggestions are made for an organized fattening of pigs.

control equipment in 2-story substations" (Letters
from readers)

Periodical : Elek sta, 6, 54-56, Je 1955

Abstract : G. M. Kayalov in his article (No. 10, 1954, this
journal) suggested the erection of 2-story substations
for 6-10 kv switchgear instead of the standard 3-story
buildings erected for industrial and regional sub-
stations. His suggestions are considered favorably
by several engineers. However, some recommendations
on the distribution of the equipment and on the layout
of the 2-story substations are made. One diagram.
