TITLE: ¹⁰Ergot¹³ of wild cereals and hybrid plants as possible material for selection of *claviceps purpurea* tul strains

SOURCE: Meditsinskaya promyshlennost' SSSR, no. 9, 1964, 46-48

TOPIC TAGS: plant reproduction

ABSTRACT:

Ergot of wild cereals and hybrid plants obtained from crossing wheat and rye with wheat grass was studied for quantitative content and qualitative composition of alkaloids. Samples were found containing the individual alkaloids ergotamine or ergometrine in adequate amount, in samples containing only alkaloids of the ergotoxin group. An ergot race was found on the meadow foxtail producing chiefly ergosine. No relationship could be established between the geographical location of the plant station and alkaloid composition in ergot, although some limitation could be established for specific chemical races to specific plantforms.

TITLE: Production of classical ergot alkaloids in saprophytic Claviceps purpurea Tul. cultures 6

SOURCE: Mikrobiologiya, v. 34, no. 5, 1965, 901-904

TOPIC TAGS: alkaloid, biosynthesis

ABSTRACT: The composition of alkaloids produced by 70 active strains of C. purpurea Tul. grown under saprophytic conditions was investigated. Polypeptide ergot alkaloids and minute amounts of water-soluble clevine type alkaloids were found. The sum total of alkaloids isolated from the mycelium amounted to 0.03% of the mycelium dry weight. Ergot mine constituted about 80% of the alkaloid content. It was obtained in pure form and identified. Ergocryptine was found in most of the samples. Ergocornine, ergocristine, ergometrine and dextroretatory alkaloids of

"Results of Treating Typhoid Patients With Tetracycline," by
K. V. Bunin and N. N. Ostrovskiy, Antibiotiki, Vol 2, No 2,
Mar-Apr 57, pp 48-50

This work describes observations of 24 patients with typical clinical manifestations of typhus who were treated with tetracycline hydrochloride. Tetracycline therapy was initiated no later than from the fifth to eighth day of the disease; the preparation was not administered to persons with mild cases, subclinical infection, or to cases admitted to the clinic late in the disease course.

Tetracycline hydrochloride was given to patients under observation in doses of 0.3 g five times a day in capsule or powder form. This dose, selected on the basis of data appearing in foreign literature and studies made in the laboratory of Prof Kh. Kh. Planel'yes, was given during the febrile period and during the 2 days after normalization of the temperature. Use of the preparation was discontinued due to side reactions in only one case.

Sum. 1345

OSTROVSKY, N. N.

On the basis of these clinical studies, the following observations are presented:

"1. Tetracycline is an effective preparation for therapy of typhus patients.

"2. The clinical effect of using tetracycline is expressed by a decrease in the degree of intoxication within 24-48 hours, and by normalization of temperature on an average of 2.6 days after the initiation of therapy, with parallel disappearance of other symptoms of the disease.

"3. Side toxic-allergic phenomena during tetracycline therapy were expressed in 37.5% of the patients by the development of hyperemia of the throat and repeated vomiting, and in some by frequent vomiting with diarrhea and abdominal pain." (U)

Abstract : In the treatment of 14 cows affected with acute serous mastitis, a high therapeutic effect was achieved by the use of novocaine block of the nerves stimulating the udder. In the case of a limited purulent mastitis, incisions with subsequent drainage of the opened purulent foci produced positive results. In a chronic disseminated suppurative mastitis, the extirpation of the affected part or of the whole udder is considered as expedient by the authors.

✓ 22. CHIEF TASKS IN STUDY OF ROCK PROBLEMS AND METHODS OF INVESTIGATION
IN CONNECTION WITH PRODUCTION OF MECHANIZED SUPPORTS. Ostrovskii, S.B.,
 (Izv. Akad. Nauk SSSR, Otdel. Tekh. Nauk (Full. Acad. Sci. U.S.S.R., Sect.
 Tech. Sci.), Mar. 1954, 19-61). Four existing Soviet mechanized supports are
 illustrated. There are three basic types: the supporting type consisting
 usually of a horizontal roof bar on two vertical supports; the protecting type
 in which curved members run from near the top of the face to a point on the floor
 behind the working space; and a combination of the two. Research methods,
 data and hypotheses are reviewed. The action required to ensure further
 progress is discussed, including the unification of plans and research methods,
 so that discoveries can be shared between the different fields. The use of
 optical and centrifugal models, in addition to those made of equivalent
 materials, is mentioned.

TITLE: Cooled steam turbine of KhTGZ, type CK-100 (SKR-100)
for super-critical steam conditions

PERIODICAL: Energomashinostroyeniye, no.6, 1962, 4-10

TEXT: A 100 MW, 3000 r.p.m. turbine with initial steam conditions of 300 atm and 650 °C with reheat to 565 °C, is described. Maximum steam consumption is 690 tons/hour with an output at the generator terminals of 101 380 kW. The turbine is designed for super-position on a medium-pressure turbine and operates against a back pressure of 31 atm. Numerous design problems were raised by the high steam conditions, necessitating several prototype variants of the first superposed turbine, so as to have a proved supercritical pressure end similar in size to that of a 300 MW condensing turbine. A two-cylinder construction was used, the first cylinder being made in two variants: one exploiting new austenitic steels in a cylinder of proved design; ✓
Card 1/4

Cooled steam turbine of KhTGZ ... S/114/62/000/006/001/006
E194/E155

and one 'cooled' in which the use of austenitic steels is reduced to a minimum. This latter type was made first. The first cylinder has one impulse and ten reaction stages, and its exhaust steam conditions are 162 atm, 550 °C. The second cylinder has ten stages, and after the third the steam is reheated to 100 atm, 505 °C. Solid couplings are used between the turbine shafts and between turbine and alternator. Cooling of the first cylinder was facilitated by the use of reaction blading which, combined with efficient glands, gives as high efficiency as the impulse blading of the austenitic variant. In the first cylinder the blading, nozzle boxes and steam delivery pipes are made of austenitic steel grade 12Kh1MFL (E1-612); all other parts are made of pearlitic steel, the rotor of grade 30Kh1MFL (E1-415) and the casings of grade 15Kh1MFL (15Kh1MFL). The cooling steam is tapped from the steam lines beyond the governor valves and is cooled by water injection to 520 °C. It is delivered in two separate flows, one of which mainly cools the rotor and the other mainly cools the inner casing of the first cylinders. Valves regulate the flows of steam to produce the required temperatures.

Card 2/4

Cooled steam turbine of KhrGZ ...

S/114/62/000/006/001/006
E194/E155

The steam inlet unions have three walls, a thin inner one being of austenitic steel. It is exposed to high-temperature steam and imposes only a slight pressure drop, being separated by a small clearance containing a little cooling steam from a surrounding screen tube which is itself externally cooled. At the inner end of the steam union the flow of cooling steam is split. Part passes over the outer wall of the inner casing to a chamber ahead of the first stage runner, from which some of it goes to cool the high pressure end gland; the rest of it cools the first stage blade roots. The other part passes through the clearance between the outer screen and the main cylinder. Cooling steam then passes over the roots of guide and rotor blades, thus avoiding excessive temperature in the rotor and the main cylinder. Beyond the last stage the cooling steam mixes with the main flow. The special arrangements that are made to overcome differential expansion effects are described. The nozzle boxes are screened from the main cylinder block, so that its temperature does not exceed 540 °C. The super-high pressure glands, of special design, are made of steel grade 1X18H9T (1Kh18N9T). Preliminary design studies of the

Card 3/4

Cooled steam turbine of KhTGZ ... S/114/62/000/006/001/006
E194/E155

cooling system were made on electrical models in the Khar'kovskiy politekhnicheskii institut (Khar'kov Polytechnical Institute) and on steam models in the works laboratories. It was found that the rotor temperature ranged from 542 °C near the second stage to 532 °C near the eleventh. The rate of flow of cooling steam is 20 tons/hour. Because reaction-type blading is used the flows of main and cooling steam are effectively separated, so that operation of the cooling system is not affected by changes in radial clearance of the main flow. Other general design features are described including the interesting point that both oil and water are used as governor system hydraulic fluids, to reduce the fire risk. The first turbine type SKR-100 will undergo full-scale trials at the Kashira Regional Power Station, the cooled variant being used first as the most promising. There is reason to believe that the design features embodied in this turbine will make it possible to design large turbines for inlet steam temperatures of 700-750 °C using proved materials and mainly austenitic. There are 7 figures and 1 table.
