TITLE: Thermal emf of certain metals and alloys in the liquid state

SOURCE: Fizika tverdogo tela, v. 8, no. 12, 1966, 3617-3620

TOPIC TAGS: thermal emf, liquid metal, indium base alloy, crystallization, electric conductivity

ABSTRACT: Inasmuch as this subject has not been thoroughly investigated in the past, the authors studied the thermal emf of six metals (Sn, Pb, Zn, In, Bi, Sb) as they go to the crystallization point, and of several liquid alloys of the In-Sn and In-Pb systems. The thermal emf was measured in a temperature range of 100° above and below the crystallization point. The samples were molten in an oven with two heaters, to permit exact control of the temperature differential. The thermal emf was measured with a photorecorder pyrometer and with mirror galvanometers, and the temperature was measured with thermocouples. The results were plotted in such a way that it was possible to obtain continuously the values of the emf coefficients, starting with the instant when both ends of the sample were liquid, to the instant when both solidified. Plots of the absolute thermal emfs of the metals and alloys tested and a table listing the change in the coordination number, the electric conductivity, and the thermal emf of the metals on going from the liquid to the solid state is presented. It is

virus. Healthy pigs, inoculated with this virus, react with an insignificant temperature rise; weakened pigs, though, are liable to succumb to the inoculation. Pigs who fall sick with the pest in a natural way, do not present any pathologic and anatomic changes because of the disease. Inoculated pigs are liable to secrete the virus during the period of three weeks following inoculation, which is dangerous for the not inoculated piglets, especially the ones of the age group of up to two weeks. Immunity begins to develop one week after inoculation, and after three months the pigs still possess the same immunity as after inoculation which uses the simultaneous method.

Search and clinical observations indicate that after haemorrhage the oxidative processes in the liver, kidney and myocardium are disordered and that there is turbance of the coronary circulation as shown in ECGs. Oxygen administration or haemorrhages may improve hepatic and myocardial oxidative processes.

Title : The Organ Size During Blood-loss and Blood Transfusions
in Decapitated Cats.

Orig Pub : Polski tygodn. lekarsk, 1955, 10, No 35, 1161-1162

Abstract : Distribution of blood during blood loss and afterward
during blood transfusion in decapitated cats, was studied
by oncometer. The size of the small intestines changes
the same as in non-decapitated animals. The reduction in
kidney size, levels off in decapitated animals more rapidly
than in the non-decapitated control animals. The
liver-size, decreased in control animals only temporarily,
in decapitated it decreases steadily and does not
return to the original size even after transfusion.

II. Klin. Chir. A.M., Krakow; Klin. Urol. A.M., Krakow - POL. PRZEGL. CHIR. 1958, 30/4 (347-356) Graphs 2 Tables 1

The excretion of Na, K, Cl, N and 17-ketosteroids in the urine was examined in 16 patients with hyperthyroidism and 6 with neutral goitre. It is stated that in these patients there is a disturbance in the functioning of the adrenal cortex, more intensified in those with thyroidism than in those with neutral goitre.

6472. THE INFLUENCE OF SURGICAL TRAUMA (PARTIAL GASTRIC RESECTION) ON THE LEVEL OF THE ELECTROLYTES AND PLASMA PROTEINS IN PATIENTS WITH GASTRIC OR DUODENAL ULCERS - Wplyw urazu operacyjnego (częściowej resekcji żołądka) na poziom elektrolitów krwi i białek osocza u chorych na wrzód żołądka i dwunastnicy - Oszacki J., Sowińska B., Adamczyk B., Marczyńska A. and Gedliczka O. II Klin. Chir. A.M., Kraków; Inst. Onkol., Kraków - POL. PRZEGL. CHIR. 1959, 31/2 (159-164)

Twenty patients with gastric ulcer and 23 with duodenal ulcer were examined. Before, 48 hr. after and 10 days after the operation the haematocrit value and the alkaline reserves, Na, K, Ca, Mg, and chlorides were examined, as well as the plasma protein and its fractions. In patients with duodenal ulcer, a statistically significant rise in the Na level was ascertained 48 hr. after operation and a statistically significant fall in the haematocrit level after 10 days. In patients whether with gastric or with duodenal ulcers, a statistically significant fall in the total plasma protein was found 10 days after operation. Patients with duodenal ulcer show a significant fall in the level of the albumins both 48 hr. and 10 days after operation. The fall in the protein and haematocrit levels after operation observed in patients with gastric or duodenal ulcer is accounted for by the retention of Na and water in the body.

"Reaction of White Mice to Intramedullary Inoculation with Encephalitis Virus."

Warsaw-Krakow, Przegląd Lekarski, Vol 19, Ser II, No 4, 63, pp 222-224.

Abstract: [Authors' Russian summary] In the course of investigating experimentally the reaction of bone tissue to various viruses, the authors found that both the S₄₇ strain and the equine encephalitis virus of the American West are pathogenic to white mice on intramedullary inoculation, and S₄₇ retained in the bone tissue even 10 days after inoculation in lethal quantities, even though encephalitis has already set in. 2391. FIRST CLINICAL APPLICATIONS OF 'FURASPOR' IN THE TREATMENT OF CUTANEOUS FUNGUS INFECTIONS - Pierwsze kliniczne próby leczenia furasporem powierzchniowych grzybic skóry - Oszaś Z. and Capińska K. Wojewódzkiej Przychodni Dermatol., Kraków; Miejsk. Zakł. Fizykaln. Lecznictwa, Kraków - PRZEGL. DERM. WENER. 1958, 8/4 (411-417)

Forty patients suffering from fungus infections of the skin were treated with furaspor (5-nitro-2-methyl-furfurylether), a new fungistatic drug produced in Poland. Twenty-two patients (15 men and 7 women) suffered from epidermophytosis of the sole and palm, and 18 patients from trichophytosis cutis glabrae. Treatment with 1-2% furaspor ointment was carried out on an out-patient basis. Furaspor proved to be non-irritant, specifically-acting and antipruritic, and stimulated epithelialization. Disappearance of the clinical symptoms and negativization of the microscopical findings were usually observed in the course of 3-4 weeks. Further study with this drug in other deep cutaneous infections seems advisable.

Title : First Experience in the Treatment of Vitiligo
by Extracts from the Fruits of Ammi Majus

Orig Pub: Przegl. dermatol. i wenerol., 1957, 7, No 1, 1-14

Abstract: According to the method of El-Mofti, the treatment of patients affected with vitiligo by the extract of the fruit of Ammi majus was carried out. Ten patients were administered the extract per os, 0.25 grams three times a day, with simultaneous smearing of the albinotic patches with a fluid extract; five patients were treated only locally, and five patients
