SOV/2063

Ovnatanov, Gurgen Tomasovich

Vskrytiye plasta i osvoyeniye skvazhin (Opening the Productive Formation and Putting the Well Into Operation) Moscow, Gostoptekhizdat, 1959. 233 p. 2,750 copies printed.

Ed.: A. S. Smirnov; Exec. Ed.: A. P. Kalantarov; Tech. Ed.: I. G. Fedotova.

**PURPOSE:** The book is intended for scientists, engineers, and technicians concerned with developing oil deposits, oil well drilling, and oil production.

**COVERAGE:** The author reviews Soviet and non-Soviet practices of opening productive formations and deals with the basic technology of oil well drilling and oil extraction. New methods are designed to increase the permeability of bottom-hole zones and the exclusion of extraneous and formation water. Attention is given to the operation of injection wells, the significance of water injection pressure during operating processes, and the periodic restoration of well reception. Data on the operation of oil wells with loosely consolidated rock masses of productive thickness are summarized. There are 124 references: 113 Soviet, 10 English, and 1 German.

AUTHOR: Ovnatanov, S.T. and Tamrazyan, G.P.

TITLE: Productivity Index for the NKP Formation of the Surakhany Oilfield  
(O koeffitsiyente nefteizvlecheniya po NKP svite surakhanskogo mestorozhdeniya)

PERIODICAL: Neftyanoye khozyaystvo, 1958, Nr 11, pp. 54-57 (USSR)

ABSTRACT: The first article on the NKP formation of the Surakhany Oilfield was published in "Neftyanoye khozyaystvo," 1948, Nr 10. The present and last article on this subject presents data on the formation's oil recovery from 1932 to 1958. The variations in the annual oil and water recoveries as well as the water factor are depicted in Fig. 2. The output of a stabilized well in the NKP formation was recorded for the years 1939-57 and the data are presented in Fig. 3. The data on the physico-geological conditions of the NKP formation are given in Table 4. The study showed that the current coefficient of oil and gas recovery from the NKP formation is 86-88 per cent and the ultimate coefficient of recovery is 89-91 per cent. It was determined that the coefficient of recovery for formations with similar geological and production characteristics can be increased to 0.9 or higher. There are 2 figures, 1 table, and 1 Soviet reference.

2751. SPLENECTOMY IN SPLENOMEGALY WITH HAEMORRHAGE (GASTRO-INTESTINAL, NASAL, UTERINE, ETC.) (Russian text) - Cvnatanyan K. T. - NOV. KHIR. ARKH. 1957, 1 (41-43)

An analysis of 24 splenectomies. Radiographical visualization of the spleen is obtained by institution of pneumoperitoneum with simultaneous introduction of gas into the large intestine. The best approach to the spleen is an oblique incision almost parallel to the left costal arch. After the removal of the spleen, careful attention to the splenic bed, haemostasis and drainage of the left subphrenic area are necessary. The author is categorically against splenectomy in cases of severe haemorrhage in patients with thrombophlebitic splenomegaly, and considers a prolonged and patient conservative method of treatment to be indicated. To combat portal hypertension, the operation of portacaval anastomosis in 7 cases, combined with splenectomy in 6 cases, was performed. The early results of these interventions were satisfactory.

TITLE: Manufacturing procedure and mechanical properties of VAD23 alloy sheets

SOURCE: Alyuminiyevyye splavy, no. 4, 1966. Zharoprochnyye i vysokoprochnyye splavy (Heat resistant and high-strength alloys), 65-69

TOPIC TAGS: aluminum alloy, copper containing alloy, lithium containing alloy, cadmium containing alloy, manganese containing alloy, titanium containing alloy, metal cladding, metal property/VAD23 aluminum alloy

ABSTRACT: A manufacturing procedure for rolling aluminum-clad VAD23-alloy sheets has been developed. It is proposed that hot rolling be done in two stages. First, the pack, a slab, and a cladding plate are welded together by rolling at 270-300C. The prerolled packs are reheated to 450-500C and rolled into a strip in a continuous mill. Nonclad sheets can be rolled in one stage at 450-500C. It was found that the plasticity in hot rolling of the alloy is greatly affected by the copper and lithium content. Susceptibility to cracking significantly increases when the copper content is above 5.3% and the lithium content is above 1.2%. With this method, sheets 0.5-5.0 mm thick were successfully rolled. Their tensile strength
