2226. OSTEO-ARTICULAR LESIONS IN THE COURSE OF PULMONARY DISEASES - Zmiany kostno-stawowe w przebiegu chorób płucnych - Pagowska-Wawrzyńska J. Państw. Inst. Reumatol., Warszawa - POL. ARCH. MED. WEWNĘT. 1957, 27/3 (349-357)

A description is given of 4 cases connected with pulmonary tumour in which the signs of osteo-arthropathy suggest a diagnosis of pulmonary neoplasm. The author draws attention to the incomplete forms of the syndrome; both the interpretation and the main theories regarding the pathogenesis of Pierre Marie's pulmonary osteo-arthropathy are briefly stated. If the osteo-arthropathy is accompanied by arthralgia this is due to malignancy and rarely to suppurative or tuberculous disease. Since the vagus nerve plays an important role in the osteo-arthropathy the author proposes to sever the vagus nerve on the side of the affected lung (in cases of inoperable carcinoma) and in other cases perform a resection of the lung.

ca

Radioactivity of samarium. G. v. HEVRSY AND M. PAHL. *Nature* 130, 446-7 (1932).—The discovery that the radioactivity of K is due to a minor isotopic constituent suggested that other common elements may also have radioactive isotopes present in small amounts. Sm was found to be markedly radioactive. The oxide has an activity 1/2 that of a thick layer of KCl of equal surface. This activity is not pptd. with Ba, Pb or Zr and its intensity is decreased 1/2 by 1.3 μ of Al. Measurements by the Geiger and Klemperer method indicate the radiation is of the α-ray type. The radioactivity is not due to any known radioactive element and this kind of radiation has not previously been known. The activity may be due to the presence of the adjacent rare element Gd in traces but this seems unlikely as all Sm preps examined showed the same activity.

The pharmacodynamics of magnesium sulfate. VIII. The effect of intravenous injections of magnesium sulfate on dogs. A clinical study. G. Nichita and I. Pahomeanu-Mesaros (Univ. Bucharest, Roumania). *Bull. acad. med. Roumanie* 17, 87-90 (1945); in French. -MgSO₄. (10⁶.) can be administered intravenously to dogs in therapeutic doses of 0.05 to 0.15 g. per kg. of body wt. In this quantity the dose can be repeated once or twice within short intervals and causes transient changes in the body functions. The dose of 0.2 to 0.25 g. can be repeated only once during the day with an interval of at least 1 hr., and it has an analgesic and anesthetic effect on the animal. Doses in excess of 0.25 g. cause respiratory failure and death through asphyxia. IX. The action of magnesium sulfate on the salivary, biliary, and renal secretions of the dog. G. Nichita and M. Stanesco. *Ibid.* 116-25. Intravenous injections of MgSO₄ inhibit the activity of the salivary glands in dogs. The normal salivary secretions are completely suppressed by even the smallest doses of MgSO₄, and the secretion stimulated by injection of pilocarpine is considerably decreased. The secretion of bile is also inhibited in proportion to the amt. of MgSO₄ administered, but unlike the effect of pilocarpine, no choleric or cholecystokinetic effects result from the application of MgSO₄. The increase in urinary vol. presumably is due to cardiovascular changes brought about by MgSO₄, and injections of pilocarpine counteracted the diuresis. Administration of CaCl₂ following injection of MgSO₄ does not modify the effect on the salivary and bile secretions; it does, however, augment the diuresis. The injection of CaCl₂ at the moment of appearance of respiratory failure (sometimes followed by cardiac failure) revives the heart and respiratory functions. Injections of MgSO₄ produce a discrepancy between the thoracic and abdominal respiration, since, while the thoracic respiration is decreased, the abdominal respiration is increased by the strong contractions of the diaphragm. X. The effect of intravenous injections of magnesium sulfate on dogs. A graphic study. G. Nichita, I. Popesco, and I. Pahomeanu-Mesaros. *Ibid.* 120-32. -Intravenous injections of MgSO₄ have the same pharmacodynamic effect on dogs anesthetized with chloralose as on nonanesthetized animals, except for the decreased resistance of the first group to the doses of MgSO₄. The MgSO₄ causes the following effects: acceleration of the

AUTHOR: Pahota, Karoly

TITLE: The cooling of gas turbine elements exposed to the effect of high temperatures

SOURCE: Energia es atomtehnika, no. 2, 1964, 62-66

TOPIC TAGS: cooling system, gas turbine element, high temperature, heat-resisting alloy, compressor, combustion chamber, stationary installation, internal cooling, liquid sodium, liquid potassium, contour, exhaust, vane, radiator, superheater

ABSTRACT: It is necessary to develop cheaper heat-resisting alloys and a simple, reliable method for cooling gas turbine elements subject to high temperatures, since the highest attainable initial gas temperature is determined in practice by the permanent strength of the structural material employed, which diminishes with increasing temperature. The thermal efficiency of a gas turbine and the structural dimensions are, in turn, considerably affected by the initial gas temperature. The output of a gas turbine is therefore a function of the aggregate of efficiency values of the compressor and the combustion chamber as well as the turbine. The

Card 1/3

ACCESSION NR: AP4018044

numerous alloys made from structural steel are reliable only up to 700-800C without cooling. Further development may be divided into two main categories according to the application of gas turbines: 1) in planes, ships, automobiles, etc., where the results obtained are very considerable; 2) in stationary installations, where structural solutions, e.g., cooling of elements subject to high temperatures, as well as metallurgic solutions, may contribute to further development, since numerous factors hindering the development of mobile equipment may be disregarded. The paper's findings regarding internal and external cooling are summarized thus: construction of high-temperature gas turbines from materials now available and with internal cooling of the vanes is practically and economically feasible. Both the one- and the two-contour internal cooling systems are satisfactory. In a one-contour system the heat carrier may be air, water or saturated steam; in a two-contour one, a liquid metal (preferably sodium or potassium) in the primary cycle and any of those used in the one-contour system in the secondary cycle. Cooling the vanes with water involves serious structural difficulties. It is economical to use air to carry off small amounts of heat; saturated steam for the same purpose, especially if the cooling system is an exhaust. With a two-contour system, steam reduces the size of the radiator or increases the heat-transmitting surface.

Card 2/3

ACCESSION NR: AP4018044

In combined steam-gas turbine installations, where the cooling system can circulate large amounts of steam, intermediate superheaters may also be used. Original has 8 diagrams and 1 table.

CA PAIC, M.

Diffusion of copper in aluminum in the presence of calcium. Microradiographic method of analysis. Mladen Paic (Zagreb, Yugoslavia). *Metal Treatment* 18, 395-9 (1951).—The core of the specimen sheets consisted of an alloy contg. Cu 3.63, Mg 1.01, Si 0.80, Mn 0.81, Fe 0.41, and balance Al. The cladding was effected by hot-rolling the cast plate forming the core between 2 sheets of Al. The Al analyzed from 99.83 to 99.70% with varying amt. of Ca. The Ca was added in the form of the oxalate. Each clad sheet was heated at 500° for 20, 80, 160, 240, or 400 min. Microradiograph prints are shown of the specimens at various stages. The microradio analysis makes it possible to follow the Cu content of the clad layer as a function of the distance from the surface and as a function of the time of heating. This permits calcn. of the Cu concn. gradient in the cladding. Comparison of the Cu concn. gradients in clad layers heated for various times at 500° shows that the rate of Cu diffusion increases with the Ca contents of the cladding. The fact that the presence of Ca in the clad layer increases the corrosion resistance cannot be attributed to an inhibiting effect on the rate of diffusion of Cu. It was also found that the Cu reaches the exterior surface of the cladding in Al of thickness 0.15 mm. after heating for about 80 min. at 500°. Lawrence H. Seabright

TITLE: The influence of collimation on the energy spectrum of 2.7-Mev neutrons

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1962, 20, abstract 8B143
("Glasnik mat.-fiz. i astron.", 1961, v. 16, no. 1 - 2, 135 - 141,
English; summary in Serbo-Croatian)

TEXT: The study of reactions induced by fast monochromatic neutrons calls for the knowledge of the spectral line shape of neutrons incident upon the specimen. For this purpose the influence of shape, size, and material of a collimator on the energy spectrum of 2.7-Mev neutrons was studied. The neutrons were obtained from a (d,d) reaction on a 200-keV Cockroft-Walton accelerator. The neutron energy distribution was measured by a Li^6I scintillation counter and a multichannel pulse-height analyzer. It has been established that clearer spectra are obtained with long collimators made from an iron-paraffin mixture. It is noted that the preferable collimator shape is the double cone.

✓ Radioautographic study of some Yugoslavian rocks. M. Paic and B. Celustka (Fac. Sci., Zagreb, Yugoslavia), *Glasnik Mat. Fiz. i Astron. Ser. II*, 11, 149-55 (1960) (in French).—This gives a table of about 100 samples of various rock types to indicate the no. of samples of each type that contain radioactive inclusions. A liquid nuclear emulsion was used directly on the surface of the thin section. The exposure time ranged from 60 to 74 days. The length of the trace of the path on photographic plate is a function of the emission energy of the α - or β -particles and can be used to identify the radioactive material. William Back
