Title : Winter Resistance of Fruit Trees with Regard to Their Location.

Orig Pub : Kolzospnuk Ukrainskii, 1957, No 6, 37.

Abstract : A brief description of the severe winter of 1949-1950 prevailing in the L'vov oblast, as well as the description of frost resistance of individual fruit species and varieties are given in this paper. It is noted that the frost damage to some apple varieties located on northern slopes is less than for those of the southern ones. The author recommends the planting of new gardens in western oblasts on the northern slopes. -- T.S. Fedosenko

TITLE:

Stabilization of the Temperature Regimen in Large Rectangular
Cloud Chambers

PERIODICAL:

Nauchnyye doklady vysshey shkoly. Elektromekhanika i avtomatika,
1959, Nr 1, pp 181-189 (USSR)

ABSTRACT:

In the work under review a basic circuit diagram for regulation
of the temperature regimen in a cloud chamber working in a
magnetic field is given. The authors proceed from the
following considerations in the construction of this circuit
diagram. The amplitude-phase characteristic and the amplitude-
frequency characteristic show that the chamber has strong
filter properties with respect to high-frequency oscillations
as an aperiodic element of first order with a great time
constant. The installation of the chamber in a thermostat
increases its filter properties. The characteristics reveal
that the thermostat is an efficient high-frequency filter.
Its use is expedient in all cases in which short-termed
external disturbances may occur. The stabilization of the

Card 1/3

✓

Stabilization of the Temperature Regimen in Large
Rectangular Cloud Chambers

65550

SOV/161-59-1-21/25

temperature regimen of the chamber consists in the elimination of external disturbances. At the same time the vertical temperature gradient in the operational range of the chamber must be maintained. This can be guaranteed only if the temperature of the lower chamber wall is equal to that of the upper one. It is shown that temperature stabilization of the upper and lower chamber wall and the compensation for disturbances (caused by the poles) may be attained by excitation of the corresponding high-frequency oscillations at the inputs of the various high-frequency ranges, provided the value of the constant oscillation component does not change. An excitation of oscillations at the input of the object is warranted by a simple mechanism consisting of a condenser (system of coils through which water flows), an electric preheater and controllers with 2 positions. The controllers act upon the preheater (according to the value of the temperature to be regulated). It was experimentally determined that the mean temperature remains constant. The specific feature of the installation is its constant load. Figure 5 illustrates such a basic circuit diagram for temperature

Card 2/3

4

Stabilization of the Temperature Regimen in Large
Rectangular Cloud Chambers

SOV/161-59-1-21/25

stabilization. Laboratory and operational tests confirmed the applicability of above circuit diagram . The publication of this article was recommended by the institute mentioned in the "Association". There are 6 figures and 3 Soviet references.

TITLE: Organization of Practical Work of Student Veterinarians
(Organizatsiya prakticheskikh zanyatiy s budushchimi veteri-narnymi vrachami)

PERIODICAL: Vestnik Vysshey Shkoly, March 1957, # 3, p 73-75 (USSR)

ABSTRACT: The article deals with the purpose and ways of conducting the practical training of student veterinarians. The purpose of practical work is to teach the students to combine theory and practice, to assist them in learning the most important work methods and to accustom them to independent work. Student practical work is conducted by small groups of 3 to 4 men who must independently conduct a clinical examination of a sick animal (make the diagnosis and a motivated prognosis, and indicate the treatment). The work is controlled by the instructor, and a larger number of students participate in the ensuing discussion of the results obtained. On one occasion a student carrying out an experiment on the intraosseous anesthesia of sheep came to the conclusion that the introduction of 10 ml (milliliter) of one- or two per cent solution of novocain into the breast bone causes a local anesthesia without any change in the animal's general condition.

Organization of Practical Work of Student Veterinarians

Another student, treating 27 horses suffering from thrombophlebitis, made in aseptic cases subcutaneous injections of a physiological solution of 50-60 ml sodium chloride around the inflammatory seat or in case of a purulent form of disease - a resection of the affected part of the vein. In one case only (a bad purulent thrombophlebitis) the student did not succeed in healing. On the question of fumigating wounds a valuable experiment proved that the bactericidity of smoke received from burning beech-plane tree sawdust was considerably higher than the bactericidal effect of smoke from fir-pine sawdust. It proved that after 1 to 2 fumigations with beech-plane tree smoke the pus from the animal's wound disappeared and the wound began to close. An article on this work is contained in # 7 of the Journal "Veterinariya" for 1954.

TITLE: A semiautomatic transfer machine for refilling the molds in autoclave
tire vulcanization. Class 39, No. 172976

SOURCE: 'Byulleten' izobreteniy i tovarnykh znakov, no. 14, 1965, 74

TOPIC TAGS: industrial automation, vulcanization, rubber working machinery

ABSTRACT: This Author's Certificate introduces a semiautomatic transfer machine
for refilling the molds in autoclave tire vulcanization. The machine is a closed
circular device with a centrally located automatic operator and devices for angular
orientation of the molds as well as for opening and steam cleaning them. The
machine is designed for complete mechanization of the process of extracting the
tire from the mold after opening, regardless of whether the finished tire is in
the upper or lower half of the mold. The automatic extraction device is made in
the form of a bracket which rotates on a vertical axle. This bracket carries a

pair of horizontal discs which move in the vertical direction. These discs are equipped with symmetrically telescoping clamps for grasping the tires from the inside in the upper or lower position.

TITLE: Study of the RbI - CsI - H₂O system at 25°C

PERIODICAL: Zhurnal fizicheskoy khimii, v. 36, no. 10, 1962, 2241 - 2243

TEXT: The following aspects of the RbI - CsI - H₂O system were determined at 25°C: solubility isotherms, the miscibility of components in the solid phase, and the change in isobaric potential on formation of solid RbI-CsI solutions. Furthermore, the activity coefficient (Table) was determined from the data of isopiestic equilibria according to H. A. C. McKay, J. K. Perring (Trans. Faraday Soc., 49, 163, 1953), and A. V. Storonkin, M. M. Shul'ts (Vestn. Leningr. un-ta, no. 11, 193, 1954). The solid phase was analyzed by using Rb⁸⁶ and Cs¹³⁴. Results: (1) The system has a eutectic point with the composition 1.42 M CsI, 7.01 M RbI, and 17.962 mm Hg H₂O. (2) At 25°C RbI and CsI form solid solutions in extremely narrow concentration ranges; in CsCl-type solutions in the range 0 < x_{RbI} < 0.163, and in an NaCl-type solutions in the range

Card 1/13

B101/B186

0.922 < x_{RbI} < 1. Between 16.3 and 92.2 mole% RbI, the components do not mix. (3) The following equation holds for the equilibrium of ternary solutions at a constant activity a_{H₂O} of water:

1/(m_{RbI} + m_{CsI}) = 1/M_{RbI} + αm_{CsI}/(m_{RbI} + m_{CsI}), where m_i and M_i are the molality of the i-th component in the ternary and binary solution, respectively, at given a_{H₂O}; and α is a constant almost independent of

a_{H₂O}. (4) The fact that the solubility of Rb⁺ is higher than that of Cs⁺, although its radius is smaller, is explained by the deviating solubility of CsI in the series of alkali halides. There are 1 figure and 1 table.

TITLE: The synthesis of isoprene from propylene
2. Isomerization of 2-methylpentene-1 in the liquid
phase in the presence of solid acidic catalysts

PERIODICAL: Neftekhimiya, v.3, no.1, 1963, 20-27

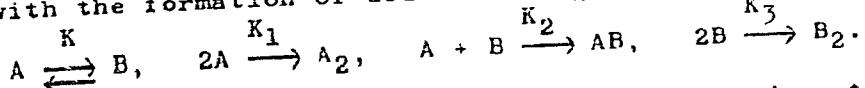

TEXT: The object of the work was to isomerize 91.4% wt. pure
2-methylpentene-1 in the liquid phase using silica-alumina,
cation exchange resin KY-1 (KU-1), phosphoric acid-kieselguhr,
alumina and silica gel as catalysts. All experiments were carried
out at 100 and 150°C and at 75 to 125°C with KU-1 as catalyst.
The isomerization is complicated by three secondary reactions, the
main of which is the formation of dodecene (dimerization of
isohexenes). A small amount of cracking gives amylenes
(especially at the higher temperatures). There is also formation
of small amounts of various isohexenes. Silica gel and alumina
were the least active catalysts. With the remaining more active
catalysts the velocity of the main and secondary reactions was much

The synthesis of ...

higher, the increased temperatures favoring the formation of dodecene and decreasing the yield of 2-methylpentene-2. Isomerization of 2-methylpentene-1 (A) to 2-methylpentene-2 (B) with the formation of dodecenes (A_2 , AB and B_2) proceeds as follows

The relative values of K and K_1 , K_2 , K_3 depend on the proton acidity of the catalysts. Thus their effectiveness may be obtained from all these values. The catalysts were rated in the order of increasing activity:

The effectiveness of acidic sites increases in the order KU-1 $< H_3PO_4 - \text{kieselguhr} < \text{silica-alumina}$. Catalysts KU-1 and silica-alumina give about 80% conversion to 2-methylpentene-2 at 75 and 100°C respectively. There are 2 figures and 4 tables.

R.) 31, 665-73(1930).—A chestnut brown soil was std. with H, Li, NH₄, Na, K, Ca, Mg, Mn, Ba, Al and Fe, resp., by treating it with the corresponding chlorides and removing the excess of salts after sain. The dried soil was then treated with sufficient water to bring it to the Atterberg flowing stage limit. The soil paste was divided into 4 portions. One portion in the form of a drop was dropped into a crystal. dish, the surface of the paste leveled off with a spatula and dried at room temp. to const. wt. The other 3 portions were placed on glass plates and the pastes made up to definite thicknesses, 5, 2 and 1 mm. The pastes were made into 5-cm. circular forms with the aid of a funnel. The pastes were then dried to const. wt. The cracks formed upon drying were sketched and photographed. From these the area was measured with a planimeter. It was found that generally the settling decreased with the increase in the valence of the adsorbed cation. The settling also varied with the thickness of the mass. Thus in the thick pastes</p>										<p>15</p> <p>Na and Li pastes settled 2 to 3 times more than the bivalent, and 6 to 8 times more than the trivalent-cation pastes. The type of cracks is also related to the type of cation. Tables and photographs illustrate the results.</p> <p>J. S. Joffe</p>
