✓ Estimation of certain quality characteristics of plates for process work. Witold Romer, M. Gredka, Z. Jackiewicz, J. Pasek, and W. Pieczczyk (Inst. Tech., Wrocław, Poland).

J. Phot. Sci. 6, 144-52 (1958).—Sensitometric criteria are proposed for measuring the "effective contrast" of photographic materials for line and halftone work. Methods of estg. the resolving power of materials in line photography and of dot quality in the halftone process are described. A dot quality coeff. is formulated. Good correlation between the contrast factor and resolution is found for material of conventional type but no correlations for materials of the "lith"-type. A linear relation is found between the dot quality coeff. and the contrast coeff. for both conventional and lith-type materials. Latitude requirements for continuous tone copying of originals are formulated. None of the materials tested satisfy these requirements. Authors—

Title : Preparation of Methyl Phthalates by Direct Addition of
Dimethyl Ether to Phthalic Acid Anhydride.
Orig Pub : Chem. prumysl, 1957, 7, No 6, 281-285.

Abstract : Study of the reaction of addition of $(\text{CH}_3)_2\text{O}$ (I) (a by-product in the production of CH_3OH from water gas) to phthalic acid anhydride (II). At normal pressure, in concentrated H_2SO_4 , maximum conversion of II, attained at $120-135^\circ$ and molar ratio of II to $\text{H}_2\text{SO}_4 = 0.8$; I, is of 85%, of which 45% are converted to monomethyl- (III) and 40% to dimethyl phthalate (IV). On elevation of temperature and lowering of concentration of II the yield of IV exceeds 50%.

STROJIRENSTVI (Mechanical Engineering, Czechoslovakia)
Vol 4, No. 5, May, 1954

Bend shaped flow meter (new method of flow rate measurement).
The method is based on measuring the difference in pressure between
the inside and the outside radii of a quarter bend section of the
piping. Any bend can be used and the internal surface quality is
of secondary importance, there are no delicate parts, no additional
pressure losses and the accuracy is about $\pm 3\%$; it can be higher
if the bend used is calibrated. The method is applicable to gases
and liquids.

TITLE:

Purification of liquid sodium coolants from oxides
and checking the content of the latter in a heat
transfer circuit

PERIODICAL:

Jaderná energie, no. 1, 1963, 8-13

TEXT: The SII heat transfer circuit was described previous-
ly. Continuous filtration of the coolant is accomplished by means
of a cold tank. The metal heated in the circuit is cooled in the
tank so that the oxides are precipitated and deposited there. The
purification efficiency increases with decreasing temperature of
the tank. The purifying installation is described in detail, inclu-
ding the analyzer for determining the oxide content in the sodium.
A short description of the purifying installation for argon is also
given. There are 7 figures.

Solution of some problems of liquid sodium application (as a high-temperature heat-transfer medium). Miroslav Palek (Tech. Acad. Sci., Prague). Acta Tech. (Prague) 5, 395-411 (1960) (in English).—The equipment layout is shown for an expl. molten Na loop that was designed and constructed for eventual use in studying high-temp. heat transfer in nuclear reactors. The molten Na loop, which has a total Na capacity of 2000 cc., was fabricated from AKVN stainless steel and included an electromagnetic pump and electromagnetic flowmeter for the Na, a sintered metal powder filter and cold trap to remove ppid. Na₂O from the flowing Na, and a column filled with liquid Na to remove oxides from the Ar used in the system. The loop was operated for a total of 800-1000 hrs. at 150-300° during an 18-month period; a Na flow rate of 2.5 m./sec. is the tubing, and a power input of 1300 w. to the electromagnetic pump. Characteristic graphs for the pump and flow meter are presented for pumping Hg and Na. The only corrosion in the loop was observed in the thin-walled (0.3 mm.) pump duct.

AUTHOR: Pašek, Miroslav

TITLE: Operational experience with an experimental heat-transfer loop with sodium coolant

PERIODICAL: Jaderná energie, no. 2, 1962, 43-50

TEXT: The article lists the design and functions of the experimental sodium heat-transfer loop installed at the ČJV - Ustav jaderného výzkumu (Nuclear Research Institute) and analyzes experiences and troubles which occurred during one year of its operation. The entire cycle consists of the actual loop, 10 m long, made of AKVN-steel pipes, and filled with 13 kg of sodium with forced circulation, the expansion vessel installed at its highest place, two charging vessels, each containing 15 kg of sodium, installed for pressure filling at its lowest place, a pressurized argon distribution system, an electric heating system for melting the sodium and

Card 1/3 X

Operational experience...

31922
Z/038/62/000/002/ 02/004
D286/D303

keeping it at a temperature of 150 - 170°C, a secondary water-petroleum-sodium cooling cycle installed for safety reasons, a filtering branch, and the necessary measuring and safeguarding equipment. After assembly, the loop was thoroughly tested for leaks by pressurized argon, the sodium was molten in the charging vessels, purified and filtered, pressed into the loop, and the circulation pump started. After test periods, usually lasting three days, the output of the circulation pump was reduced to one third and the temperature of the petroleum coolant kept at 100 - 110°C till all parts of the loop were equally cooled. The pump was then stopped and the sodium permitted to solidify in the loop. When the operation was resumed, the sodium was gradually and progressively heated, starting at the expansion vessel. Several times, the sodium was also emptied into the charging vessels by pressing argon into the loop, and the system was dismantled and cleaned. The author then describes and analyzes defects which occurred during operation, namely the deformation of a copper tube in the sodium/sodium counterflow exchanger, the diffusion of liquid sodium through microcracks near soldered joints be-

Card 2/3

Operational experience...

tween copper tubes of the electric heater and stainless AKV-steel sleeves, the damage of an electromagnetic flowmeter tube, etc. Metallographical analyses, made by the Výzkumný ústav ochrany materiálů (Research Institute for Material Protection) in Prague, showed no intercrystalline corrosion, so that it can be assumed that the damage was caused by mechanical stress only, i.e. by differential expansion and material expansion occurring during sodium melting and solidification. As a result, it is suggested winding filaments around AKV-stainless-steel pipes instead of copper pipes, and an improved heating system has been developed with an input of 800 W/l m² of loop pipes and with intensified heating at fittings, flanges, etc. The author thanks Engineer I. Řezníček, O. Španinger and J. Rosa for valuable assistance. (Technical editor: A. Ševčík) There are 10 figures.

higher accuracy than the recording device of the test machine itself, the error being of the order of tenths of a percent. The force was measured by the equipment built into the test machine, the error being $\pm 1.5\%$ and the measurement was again made by means of a photographic recording. Curves were determined and plotted for the Czech steels ČSN 11 341, 11 523, 13 240, 14 331. The determined values are intended for use and were used by technologists concerned with extrusion, upsetting, rolling and other processes of forming these steels, the compositions of which are as follows. ČSN 11 341 - 0.05% C, 0.01% Si, 0.31% Mn, 0.016% P and 0.056% S; ČSN 11 523 - 0.21% C, 0.30% Si, 1.54% Mn, 0.043% P and 0.041% S; ČSN 13 240 - 0.36% C, 1.21% Si, 1.18% Mn, 0.016% P and 0.034% S; ČSN 14 331 - 0.28% C, 1.20% Si, 0.95% Mn, 0.86% Cr, 0.17% Ni, 0.21% Cu, 0.018% P and 0.016% S.

There are 5 figures, 4 tables and 11 references: 9 Soviet-bloc and 2 non-Soviet-bloc.

TITLE: Rotary amplifiers as astatic regulators

PERIODICAL: Elektrotechnický obzor, v.51, no.1, 1962, 583-591

TEXT: The conversion of a normal rotary amplifier into an astatic regulator by the use of a critically adjusted positive feedback is investigated. The advantage of astatic elements in a closed control system is illustrated by the following example. Fig.12 shows a control circuit involving an amplidyne as an astatic regulator. The problem is to keep a constant current in the main circuit including the alternator D, which is excited by the amplidyne with positive feed back. It is required to change the voltage u_4 in such a manner that the current i_5 remains constant. The stability of the control circuit is obtained by inserting a stabilizing transformer between the input and output of the amplidyne. In Fig.13 are the measured characteristics for the following cases: 1) no positive feedback, 2) critically adjusted positive feedback, 3) supercritical positive feedback. An analysis of the dynamic properties of the control

TITLE: Hybrid system of program control of short-circuit tests

SOURCE: Elektrotechnicky obzor, v. 54, no. 9, 1965, 406-416

TOPIC TAGS: automatic control equipment, coincidence circuit, switching circuit

ABSTRACT: The article defines the principal demands on automatic equipment for the control of short-circuit tests. The newly developed control equipment for setting

up exact switching programs was realized by hybrid techniques. The digital section of the system includes a counter of the half-period of the control voltage and a system of coincidence circuits. To it a continuously operating section (analog section) is linked, consisting of synchronized circuits for continuous shifting of the instant of occurrence of the pulse within the half-period following the last half-period of the chosen partial interval. The equipment as a whole controls all necessary switching processes in short-circuit tests. The results of numerous measurements have shown that the switching operations are programmed under usual service conditions with an accuracy exceeding 1° el, a discernment of 0.2° el, and a reproducibility of the same repeated program of 0.15° el. Orig. art. has: 20 figures, 5 formulas and 1 table. [Based on author's Eng. abst.] [JPRS]
