TITLE: Standardisation of Discs for Grizzly Screens and  
Specialisation of their Production (Unifikatsiya diskov  
koksovykh grckhotov i spetsialisatsiya proizvodstva ikh)

PERIODICAL: Koks i Khimiya, 1958, Nr 5, pp 45 - 49 (USSR).

ABSTRACT: The variety of shapes and dimensions of discs for grizzly  
screens is discussed. The necessity for standardisation of  
their shape, dimensions and methods of production is stressed.  
It is considered that the manufacture of discs should be  
centralised. There are 5 tables and 6 figures.

COUNTRY : USSR  
 CATEGORY : Forestry. Forest Cultures. K  
 ABS. JOUR. : McBicl., No. 14, 1959, No. 63242  
 AUTHOR : Pashkov, G. D.; Duguyin, D. K.  
 TITLE : Dependence of the Growth of Oak Seedlings on Number  
 in the Cluster  
 ORG. J. PUB. : Izv. zap. Kustovsk. univ. Leningr., 1957, 28, 63-74

ABSTRACT : To explain the peculiarities of development of oak as  
 depending on the number of oak seedlings in the cluster,  
 three forest belts established by the cluster method in  
 Kustovskaya plant (in 1949) were studied in 1953. The  
 number of seedlings per cluster varied from 1 to 25-30.  
 It was established that the greater the number of oak  
 seedlings in the cluster, the greater the height attained  
 by the principal mass. The thickness of the seedlings  
 at the same height decreased with increase in the number  
 of plants in the cluster.--O. V. Fedotova

ABSTRACT: Increases in the operational temperatures of a number of tools and apparatus promoted research into developing coil wires capable of performing satisfactorily at 500C and higher. The problem was twofold: (1) selection of the conductor core and (2) development of electrical insulating coatings which can assure reliable performance of the coil wire at high temperatures. Nickel-plated copper wire was used for coil wires performing at 400-500C and nickel wire for 500-600C. The development of insulating coating was based on some mineral compounds and fusible glass (silicate) enamels. The fusible silicate enamels contained

1/3

ACC NR: AT5027951

151

large amounts of fluxes, often including alkalis. The electrical conductivity of many glasses had an ionic character and increased with increased amounts of mobile ions, in particular of alkalis. For a silicate enamel free of alkali oxides, M-33 enamel [Abstractor's note: composition not given] was developed within the  $\text{SiO}_2\text{-PbO-B}_2\text{O}_3$  system. It was applied from aqueous suspension by immersion or by electrophoresis, and the coating was fixed on the wire at 850C. The thermal expansion coefficient of this type of enamel (at 20-500C) was  $9.8 \times 10^{-6}$ , the volumetric resistivity  $\sim 10^{10}$  ohm cm at room temperature, and  $10^8$  at 500C; the breakdown voltage of the insulation at a thickness of 7-10  $\mu$  in coils was 380 v. at 20-500C. The wire could be wound on a magnetic core having a diameter 50 to 60 times larger than that of the coil wire. Coating with organosilicate preparations Ts-5, V-58, or S-2 of the silicate enamel coating M-33 improved the elasticity and electric properties of the coil wire. Coil wire with a thickness of 25  $\mu$  by diameter could be wound on a magnetic core having a diameter 15 times larger than that of the coil wire. Its breakdown voltage in the coil was 400-450 v. It decreased to 250 v after 800 hours at 500C. The elasticity decreased simultaneously the coil wire could then be wound on a magnetic core with a diameter 25 times larger than that of the coil wire. Heating to 600C sharply decreased the elastic properties of the insulation. This coil wire was designated as PEZnB (proved

SUBJECT: USSR/Welding.

AUTHORS: Pashkov I.V., engineer; Lyulenkov G.G., engineer.

TITLE: Examples of automatic welding aluminum under flux. (Primary primeneniya avtomaticheskoy svarki aluminiya po flyusu).

PERIODICAL: "Svarochnoye Proizvodstvo", 1957, #1, pp 18-20 (USSR).

ABSTRACT: Practical experience in welding aluminum at the authors' plant was based on research work by the Electrical Welding Institute im. Paton, and other research organizations. Until now, welding of aluminum was practiced in shielding gases, by the oxyacetylene method, and by hand.

The new process considered, consists of welding with a melting electrode and a half-open arc, under flux AM- Al (flux AN-Al) developed by the im. Paton institute. Its components: 50 % KCl, 15 % NaCl, and 35 % criomnite. It completely dissolves the oxide scab, but works well only when used in the form of molten mass. The article gives detailed technology of producing this flux.

The welding tractor TC-17M (TS-17M) has been adapted for welding aluminum by adding cooling water chambers and opening

TITLE: Professor K. V. Urnov

SOURCE: Elektrichestvo, no. 3, 1965, 91

TOPIC TAGS: scientific personnel, academic personnel

ABSTRACT: Konstantin Vasilevich Urnov died on 11 December 1964 after a serious illness. He was a distinguished scientist and one of the oldest electro-polygraphists. He was born in 1907 and graduated from the Ivanovskiy Polytechnic Institute in 1929, after which he continued to work on the Board of Electric Installations for the next 25 years. His outstanding contribution was to relate successfully the activities of industry with those of the higher educational institutions. His name is closely linked to the development of domestic polygraphic machinery. He was imaginative, creative and bold. Since 1935 he was also engaged in teaching and scientific research work at the Moscow Power Institute and the Moscow Polygraphic Institute where he set up a course on "Electric Drives and Automation of Polygraphic Machines". He is the author of over 30 inventions and published works, including one book. He was a scientist-communist, a man of great knowledge, a good colleague and friend. Orig. art. has: 1 figure. [JPRS]

TITLE: Electron microscope investigations of thermal vacuum treated surfaces of germanium crystals

SOURCE: Bulgarska akademiya na naukite. Fizicheski institut. Izvestiya na Fizicheskiya institut s ANEB, v. 13, no. 1, 1965, 95-101

TOPIC TAGS: crystal surface, germanium, germanium single crystal, surface treatment, heat treatment, vacuum treatment

ABSTRACT: Electron microscope investigations show that the thermal vacuum treatment of surfaces of germanium crystals makes it possible to clean off the surface of the crystal from the amorphous layer produced by preliminary mechanical and chemical treatment. A characteristic band-like structure of the {111} surface of the thermally treated crystals has been observed. The author thanks Prof. Kh. Batge, Director of Institute of Electron Microscopy, GAN, for
