at a temperature of 30, 50 and 100° were studied. Unused Cu in the solution was determined polarographically on a base of NH₄Cl plus NH₄OH. The stability of the dyes to friction, washing, water and the effect of light was also determined. It was established that with an increase in treatment temperature, the rate of absorption and the quantity of coupled Cu increases. At 100°, depletion comprises almost 100 percent. At any temperature, a state of equilibrium sets in in 20 minutes. Qualitative indicators of color are best obtained at a

Title : A Polaroscopic Investigation of Solutions of Vat
Dyes.

Orig Pub: Magyar textiltechn., 1958, 10, No 4-5, 154-157.

Abstract: The possibility of a polarographic analysis of
solutions of vat dyes (VD), and particularly the
possibility of a polarographic determination of
 $\text{Na}_2\text{S}_2\text{O}_4$ (D) and VD when present together in a
solution, was investigated. It was established
that at a higher than the determined (critical)
concentration, the leucodye distorts the polaro-

Abstract: gram of D. The critical concentration is determined by acidifying the leucobase in an alkaline medium and subsequent gravimetric determination of the precipitate. By diluting the solution (in the absence of air) to a concentration less than the critical one, the quantitative determination of D becomes possible. At a temperature higher than 20°, the determination of D also becomes possible on the cathode wave, which, at a constant temperature, changes in proportion to the concentration of D. The polarographic activity of leucccompounds of VD makes it possible to determine, by this method, their

Title : The Reaction of Wool With Acids.

Orig Pub: Przegl. wlókienn., 1958, 12, No 2, 70-74.

Abstract: The influence of liquid volume and temperature upon the acid fixation by wool was investigated. It was found that the amount of fixed acid depends on its total amount and not on its concentration. The hydrolysis of wool takes place at an elevated temperature. In this case the amount of fixed acid must be accounted for in a corrected weight of the wool.

Abstract: heights appear at about 20 to 25°. The height of the two last waves rises with the temperature rise, while the 1st anode wave decreases gradually and disappears completely at about 90°. These changes are reversible - the initial picture is restored at the temperature drop. Considering the temperature factor and the effect of the mercury level on the limiting current, the author arrives at the conclusion that the 2 last waves are of a kinetic character and correspond to some product produced on the electrode surface and taking part in the anode and cathode reactions with the same number of electrons (RZhKhim, 1955, 54744). The 1st anode wave is used for the determination of I. The calibration graph is plotted in accordance

"Experience with the Methodology of the In Vitro Determination of Thyroid Hormone,"

Budapest, Biopolis, 1973, No. 5, Oct 63, p. 66-74.

Abstract: [Authors' own summary] The Röhlipy test, a simple, very reliable method is described by the authors. Diagnostic information can be obtained by this method about thyroid function, without exposure to radiation. During pregnancy, in immature and mature infants, the behavior of the thyroid hormone-binding protein of the plasma should also be determined. The influence of hematocrit anomalies on the Thyroxine-uptake of the erythrocytes can be corrected for by the introduction of the Adams' coefficient. 13 Western, 5 Hungarian references.

2-hydroxy-3-naphthalide and its derivatives

SOURCE: Academia scientiarum hungaricae. Acta chimica, v. 43, no. 2, 1965, 111-119

TOPIC TAGS: polarographic analysis, nonmetallic organic derivative, organic nitrogen compound

ABSTRACT: [Part 5 of this series was published in Chem. Zvesti, Vol. 19, 1965] The oscillopolarographic activity of the various derivatives of Naphthol AS (2-hydroxy-3-naphthalide) was practically identical. The results of these studies indicate that this type of azo-dye component may be employed by the same method, irrespective of composition, and that the oscillopolarographic technique is a suitable means for investigating textile chemicals of this nature. The authors express their thanks to Prof.-Dr. J. Heyrovsky, Dr. J. Kuta and Dr. M. Heyrovsky for their valuable remarks and advice and to Dr. K. Gyorbiro, Candidate of Sciences, for making possible these experiments with a polarograph Radiometer PO 3. Orig. art. has: 13 figures. [JPRS]

"Immunothyroiditis in Children"

Budapest, Orvosi Hetilap, Vol 107, No 11, 13 Mar 66, pages 487-490

Abstract: [Authors' Hungarian summary] In the course of presentation of three patients, some problems of immunothyroiditis in children are discussed. Two of the patients were girls of prepuberal age; in one case, an extremely high antithyroid-antibody titer and histological evidence; in the other case, merely the histological findings - which showed the presence of carcinoma as well - indicated the existence of immunothyroiditis. In the third patient, an infant, the disease was diagnosed on the basis of serological evidence; the disease may have started during intrauterine life. Following the presentation of the cases, the more important aspects of diagnosis and therapy are summarized. 7 Eastern European, 36 Western references.

"Loss of Effect of the Antidiuretic Hormone in the Organism of Normal
and Obese Children"

Budapest, Orvosi Hetilap, Vol 107, No 24, 12 Jun 1966, pp 1110-1111.

Abstract: The deactivation of the antidiuretic hormone was investigated in eight children ranging in weight from normal to obese. The rate of antidiuretic hormone deactivation increased with increasing degree of obesity. The significance of this phenomenon in the interpretation of published data regarding deactivation rate was discussed. No definite relationship between syndromes coinciding with adiposity and antidiuretic hormone deactivation rate could be established. 15 references, including 4 German, 7 Hungarian, and 4 Western.

Quantitative determination of some compounds with a polyethylene glycol
ether skeleton, using an oscillopolarographic method

SOURCE: Magyar kemial folyoirat, v. 71, no. 9, 1965, 372-376

TOPIC TAGS: polarographic analysis, polyglycol compound

ABSTRACT: Three different polyethylene glycol derivatives have been studied by means of an oscillopolarographic method. It was determined that the compounds studied 1) are active in a 1 M KCl and 1 M NaOH basic solution, 2) they can be determined quantitatively in a 1 M NaOH basic solution with an accuracy sufficient for industrial control determinations, and 3) their quantitative determination by means of oscillopolarography is much more rapid than the traditional analytical procedures. Quantitative Determination of Some Polyethyleneglycol Ether Surface Active
Agents by the Oscillopolarographic Method."

Budapest, Magyar Nemzeti Polyoirat, Vol 72, No 3, Mar 66; pp 105-107.

Abstract [Authors' English summary]: Experiments were carried out to study the possibilities of the quantitative determination of surface-active agents of the polyethyleneglycol ether type. It was found that the investigated compounds can be qualitatively determined within the concentration range of 0.2-0.8 g/liter. Identification can be performed on the basis of the shape of incision at $Q=0.92$. The determination is much more rapid and much simpler than by methods in general use. "Data on the Development of Locomotion in Infants."

Budapest, Orvosi Hetilap, Vol 107, No 46, 13 Nov 66, pp 2172-

Abstract: Some data on the development of locomotion in 736 normal, healthy infants are reported. These children were supplied with suitable clothing, adequate toys and space but received no help in learning skills from adults. It was concluded that the infants acquired new forms of locomotion (turning, sitting, standing, etc.) without any help. The various stages were reached, in general, at about the same age as reported in the literature for infants who received help from adults. It is also suggested that children who acquire the various skills of motion without aid will, in general, develop more economical, steady, harmonic, coordinated motions; although they are very brave in their move-

TITLE: Polarographic investigation of the autoxidation of sodium dithionite

SOURCE: Academia scientiarum Hungaricae. Acta chimica, v. 43, no. 2, 1965, 63-75

TOPIC TAGS: polarographic analysis, oxidation kinetics, sulfur compound

ABSTRACT: The kinetics of the autoxidation of sodium hyposulphite was investigated by polarography and some data were obtained on the chemistry of the reaction. The experiments led to the following conclusions. A) Kinetics of oxidation.¹ The polarographic method, based on the measurement of the limiting current, provides the means for the quick and accurate kinetic study of the oxidation of dithionite. In an unstirred solution, the rate of oxidation is limited by the slowest partial process, diffusion. When the rate of diffusion is increased by passing air through the system, this rate will become comparable to the rate of reaction. Under such conditions, chemical activation (pH) will also take part in the determination of the overall reaction rate. The study of the factors which affect the rate of autoxidation lead to the conclusion that the stability of dithionite solutions is increased if exposure to air is avoided, the solution is not agitated, the storage temperature is low and the highest permissible pH value is maintained. B) Chemistry of oxidation. Any sulfite present in the products of the oxidative decomposition of

ACC NR: AT6031098

dithionite can not be detected by polarography since the sulfide is polarographically inactive in an alkaline medium. The formation of thiosulfate, in the course of the oxidation, has been confirmed. Since thiosulfate is inactive at pH values higher than 11, it can only be detected by polarography in solutions with a pH below 11. Although sulfide is polarographically active in alkaline solutions as well and it can be detected at concentrations of 3×10^{-4} g-mole per liter, its presence could not be demonstrated in oxidized dithionite solutions. When hot dithionite solution is subjected to vigorous oxidation, small amounts of trithionate are also formed. Orig. art. has: 10 figures and 7 tables. [Orig. art. in Eng.]

TITLE: Application of oscillopolarography in some textile-chemical investigations.
Part 10: Quantitative determination of sodium dodecyl sulfate in an aqueous solution with the aid of oscillopolarography

SOURCE: Magyar kemiai folyoirat, no. 2, 1966, 68-71

TOPIC TAGS: polarographic analysis, sulfate, chemical precipitation

ABSTRACT: The experiments were performed with a Polaroscope Krizik P 576 instrument, equipped with a mercury anode and a dropping mercury cathode. By utilizing a 1-mol. sodium hydroxide basic solution, the polarographic curve cut was in a linear relation with the concentration of sodium dodecyl sulfate in the solution within the 0.9×10^{-4} mol./l. range, thus permitting analyses to be performed at an accuracy of $\pm 2\%$. Analyses could also be performed in a 1-mol. hydrochloric acid basic solution; however, the accuracy was lower in this case. Analyses could not be performed in a 1-mol. potassium chloride basic solution since the sodium dodecyl sulfate precipitated from the solution in the course of the determination. TITLE: Determination of the concentration of nonionic surface-active agents¹ of the polyethylene glycol type by the polarographic wave-splitting method. I. Investigation of oxyethylated fatty alcohol sulfonate

SOURCE: Magyar kemini folyoirat, v. 71, no. 11, 1965, 490-493

TOPIC TAGS: surface active agent, sulfonic acid, nitrobenzene, polarographic analysis

ABSTRACT: The polarographic wave-splitting method can be applied for the determination of nonionic surface-active agents of the polyethylene glycol type. The compounds tested split the wave of the sodium salt of metanitrobenzene sulfonic acid, used as an indicator. The ratio of the height of the waves and/or their shift on the potential range can be used for the quantitative determination of the compounds investigated. The determination can be performed in the concentration range of 0.01-0.1 g/liter. Orig. art. has: 8 figures and 2 tables. [Based on author's Eng. abstr.]

Part 6: Relations between the structure of 2-hydroxy-3-naphthalimide and its
derivatives and their oscillo-polarographic behavior

SOURCE: Magyar kemiai folyoirat, v. 71, no. 1, 1965, 1-5

TOPIC TAGS: polarography, adsorption, electrode, desorption, organic nitrogen
compound

ABSTRACT: [Part 5 of this series was published in "Chem. Zvesti," Vol 18,
1964, p 444] The oscillo-polarographic activity of 2-hydroxy-3-naphthalimide
and its substituted derivatives was attributed to the adsorption and de-
sorption of the molecules at the surface of the dropping mercury electrode.
The tendency of forming adsorption layers is caused by the part of the mole-
cules having the structure of salicylic acid anilide. The applications of

Though much improvement has been attained in such institutions the signs of hospitalism are still evident, especially in infant homes. The causes are not only of a physical nature; a better organization of the institutions may serve to combat it. Good ventilation, undisturbed sleep, possibilities of moving about and playing, adequate division of the children into groups, maintenance of a practical order of the day are primary necessities. Paediatricians should not only pay attention to the sick, but also to the healthy children.

TITLE: A gas discharge chamber

PERIODICAL: Pribory i tekhnika eksperimenta no. 6 1961 49-51

TEXT: A brief version of this article was communicated to
the International Conference on High-energy Nuclear Instruments
at Berkeley in September 1960.

The present chamber is similar to those described by S. Fukui and
S. Miyamoto (Ref. 1: Nuovo cimento 11 1959, 113) and
S. Fukui, S. Miyamoto (Ref. 2: Physical Institute Nageva University
Japan Preprint 1959). It differs from ordinary spark chambers
in that the electrodes are separated from the working volume by a
dielectric. The authors have investigated chambers with plane
electrodes (25 x 10 cm²) at a distance of 7 cm. The chambers
were filled with neon to a pressure of 760 mm Hg with an added
argon impurity (0.3-0.45%). In addition to the properties
investigated in Refs. 1 and 2 the present authors have studied

Card 1/2

A gas discharge chamber

33110
S/120/61/000/006/006/041
E032/E114

the dependence of the amplitude of the high-voltage pulse applied to the chamber on its length (for visible tracks) and magnitude of the clearing field. It was found that when the argon impurity is 0.4-0.45% and the electric field is 5.4 kV/cm the maximum angle at which the discharge will always occur along the track of the particles is 30°. At larger angles both normal and distorted tracks are observed. Examination of photographs of tracks at 30° showed that there was a systematic displacement towards the positive electrode by about 1 mm relative to the direction of motion of the particle. Acknowledgments are expressed to A.A. Tyapkin and V.I. Salatskiy for discussions. There are 4 figures and 2 non-Soviet bibliographies. The English language reference (Ref. 2) is quoted in the abstract.

TITLE: Measurement of the spin correlation coefficient for
pp-scattering at 660 Mev

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42,
no. 5, 1962, 1209-1211

TEXT: The spin correlation coefficient C_{kp} was measured for elastic
proton-proton scattering at an angle of 90° , the 660-Mev protons being
scattered on a polyethylene target (Fig. 1). The scattered protons and the
recoil protons were recorded by coincidences in the telescopes T_1 and T_2 .
The solid angle of the two telescopes was $0.7 \cdot 10^{-3}$ steradion. The
amplitude of elastic pp-scattering can be represented in the form
 $M = \alpha + \beta (\sigma_1 n) (\sigma_2 n) + \gamma (\sigma_1 + \sigma_2) n + \delta (\sigma_1 K) (\sigma_2 K) + \epsilon (\sigma_1 P) (\sigma_2 P)$ (1).

α , β , γ , δ , ϵ and the scattering amplitude coefficients are related by

C_{kp} Card 1/3

S/056/62/042/005/010/050
B104/B102

Measurement of the spin correlation ...

$I_0(\theta)C_{kp}(\theta) = -Im(de^*)$, where $d = b - \epsilon$, $\epsilon = 27$, and $I_0(\theta)$ is the differential cross section of elastic pp-scattering (cf. Oehme, Phys. Rev. 96, 147, 1955). The proton spin states after scattering were determined with the aid of two identical carbon targets. The telescope T_3 and T_4 were in anticoincidence with the telescopes T_1 and T_2 . The direction of motion of the protons before and after scattering from carbon targets was determined with gas discharge chambers. Results: The correlation asymmetry factor is 0.054 ± 0.041 , $C_{kp}(90^\circ) = 0.22 \pm 0.16$. This work is part of an experimental program for determining the scattering amplitudes and for conducting a phase shift analysis. There are 2 figures.

TITLE: Measurement of spin correlation coefficients in elastic pp
scattering at 315 MeV energy

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 47,
no. 3, 1964, 848-854

TOPIC TAGS: spark discharge chamber, spin correlation, correlation
coefficient, elastic scattering, proton proton scattering, phase
shift analysis

ABSTRACT: The spin correlation coefficients in elastic pp scatter-
ing were measured at an energy of 315 MeV and at an angle of 45° in
the c.m.s., using a spark-chamber whose construction and character-
istics were described earlier (Legar, Nikanorov, Peter, and Pisarev,

Card 1/3

L 10763-65

ACCESSION NR: AP4046397

13

Preprint, OIYaI, R-1449, 1964). The proton scattering and analyzing setup is described. The values obtained for the spin correlation coefficients are $C_{mn} = +0.90 \pm 0.51$ and $C_{kp} = 0.74 \pm 0.51$. Using these spin-correlation values, a phase-shift analysis of pp scattering at 310 MeV was made, in which both sets of pp scattering phase shifts obtained at 310 MeV (Yu. M. Kazar'nov, I. N. Silin, ZhETF v. 43, 1385, 1962) were varied. An analysis of the results indicates that the existence of the first set of the previously obtained phase shifts is more likely than that of the second. "The authors thank S. N. Sokolov, V. I. Nikanorov, I. Bystritskiy, and A. M. Rozanova for help with the work, G. S. Revenko, P. F. Pisarev, A. I. Yegorov, V. F. Ustinov, and V. M. Sakovskiy for erection of the apparatus and for help with the experiments, and R. I. Zaplatina, M. Uglirzhova, V. V. Ukleykina, and V. A. Maksimova for scanning the films. TITLE: Thin-electrode chamber and studying the position of the spark-
"rectification" point

SOURCE: Pribory i tekhnika eksperimenta, no. 1, 1965, 59-64

TOPIC TAGS: spark discharge chamber, spark chamber

ABSTRACT: The position of the point, on an inclined particle track, from where the spark arises (the "rectification" or straightening point) was studied, with 25- and 280-Mev protons, in spark discharge chambers with 7-micron Al foil. Both sides of this thin foil were active. The chambers were filled with 99.6% Ne and 0.4% Ar at 760 torr. The effect of the particle energy and their track angle in the chamber upon the distance between the negative electrode and the "rectification" point was investigated. It was found that the Townsend factor increases with

TITLE: Investigation of the characteristics of discharge chambers filled with neon with various additions

19

SOURCE: Pribory i tekhnika eksperimenta, no. 1, 1965, 64-68

TOPIC TAGS: discharge chamber, spark discharge chamber

ABSTRACT: Six 25 x 10 x 7-cm glass chambers with thin semitransparent stannic-oxide electrodes were tested. They were filled at 760 torr with neon with admixtures of A, H₂O, C₂H₅OH, CH₄, and CCl₄. For the first experiment, all six chambers were filled with a standard mixture of 99.6% Ne and 0.4% A; their memory time was 16 μ sec. One of the chambers was left intact for 2 yrs, whereupon it was tested again: its memory time decreased to 5 μ sec, while its maximum angle of slope of discharge and the quality of tracks remained

Card 1/2

L 47080-65

ACCESSION NR: AP5007026

unchanged. Another chamber was used for studying the diffusion of initial electrons from the particle track. The remaining four chambers were used for investigating the effects of the above additions to the standard mixture. It was found that the introduction of 0.1% CH₄ results in a memory-time reduction from 16 to 1 μsec; an addition of 3×10^{-6} % CCl₄, from 16 to 1.6 μsec. The addition of H₂O and C₂H₅OH does not improve the time characteristics. "The authors wish to thank A. A. Tyapkin for his useful advice and discussions about the development of discharge along the particle track." Orig. art. has: 3 figures and 1 table.

TITLE: Electron-optical gas-discharge spark light converter [0]

56

SOURCE: Pribory i tekhnika eksperimenta, no. 4, 1963, 128-131

TOPIC TAGS: Light converter, spark light converter, spark-discharge light converter, gas-discharge light converter, electron-optical light converter, charged-particle detector

ABSTRACT: A new type of electron-optical converter for the detection of charged particles which uses a spark discharge in gas is described and its characteristics experimentally studied. The converter consists of a cylindrical container with flat ends. A transparent photocathode is deposited on the inner surface of the front end, and two grids run parallel to the cathode; the first functions as a governing valve and the second as the anode. Electrons emerging from the cathode and drawn toward the positively biased first grid proceed toward the anode and develop a spark discharge if an anode voltage pulse of proper intensity is applied at the proper instant. By varying the bias pressure in the container and the duration of the pulse, the discharge channel can be made so thin that it

Cord 1/3

L 1426D-63

ACCESSION NR: AP5004905

appears as a light flash point if observed from the anode. The track image of a multiplicity of such particles will appear as a number of luminescent dots on the scintillator screen. One of the models investigated was a plexiglass container with the grids made of 0.1-mm brass sheet with 30×30 openings per cm^2 ; and an aluminum plate serving as the photocathode. The three electrodes were 10 mm apart. The container was filled with a mixture of neon with 0.5% argon to a pressure of 760 mm Hg. At the instant of passage of a particle between the cathode and the +100-v governing screen, a 10-kv pulse of 1.2×10^{-7} sec was applied to the anode. Another model investigated was a glass container with the same electrode arrangement and was designed for finding the most advantageous composition and pressure of the filler gas. The lower pressure limits for obtaining thin sparks at a pulse voltage of 3 kv was found to be 60 mm Hg for neon and 5 mm Hg for xenon. Further efforts, directed toward improvement of photocathode sensitivity, were unsuccessful. However, it was established that the light amplification factor can easily be varied within a wide range by manipulation of the anode-pulse amplitude. The resolution time was found to be about 0.1 to 0.3×10^{-6} sec. The main advantages of the design over conventional electron-optical converters, apart from its simplicity, lie in its better resolution time, low background, and flexibility of governing the amplification factor. The main disadvantages are a lower screen

Card 2/3

L 14260-63

ACCESSION NR: AF3004905

resolution and the inability of the device to render half-tones, which restrict its application to the recording of charged particles and cases where "fineness" of rendering is not important. Orig. art. has: 3 figures.

TITLE: Characteristics of a multilayer spark-discharge chamber with various
filling gases

SOURCE: Pribory i tekhnika eksperimenta, no. 6, 1964, 39-44

TOPIC TAGS: spark discharge chamber, multilayer spark chamber

ABSTRACT: The results of an experimental investigation of the characteristics of a 27-electrode spark chamber filled with Ne+0.4% A or He or Ne+20% He are reported. The effects of the clearing field, pulse delay, gas pressure, and gas type upon the efficiency of recording charged particles were studied. It was found that the efficiency vs. pulse-delay curves have no gradually falling-off "tails." The curves for Ne+0.4% A and Ne+20% He drop steeply, which fact is favorable

for using these gas mixtures in the chambers operating with high background noise. The storage-time vs. clearing-field curves have a minimum at 0.3-0.4 microsec. An increase in the efficiency and storage time with increasing the clearing-field amplitude is most probably due to metastable states of basic-gas atoms which are formed by the drift energy of initial electrons in the clearing field. The spark chambers can operate efficiently at low gas pressures. The plateau length for the above gases is about 7-8 kv. Orig. art. has: 7 figures.

TITLE: Testing the models of gas-discharge image converters ✓

SOURCE: Pribory i tekhnika eksperimenta, no. 4, 1966, 157-160

TOPIC TAGS: image converter, gas discharge

ABSTRACT: A principle of operation of a new gas-discharge image-converter tube was suggested by the authors in PTE, 1963, no. 4, 128. The present article reports the results of some studies of the sensitivity and operability of the photocathode in the presence of gas, of the passage of electrons through the metal screen, and of the definition of reproduced image. Plots of photocurrent vs. voltage for various neon pressures and of photocurrent vs. neon pressure show that the tube has acceptable sensitivity only at gas pressures under 1.3 kn/m^2 . Satisfactory grid through factor was obtained with a large-mesh grid in a tube filled with neon at 0.7 kn/m^2 or lower pressure. Further experiments revealed that a single-stage tube cannot handle the spark-type image because of undesirable optical feedback. Models of two-stage tubes produced a visual slit image, whose intensity, however, was not

sufficient for photographing. Hints for improving the tube performance are given.
"In conclusion, the authors wish to thank A. G. Nikolayev for his help in building
the tube models." Orig. art. has: 5 figures. [03]

937. PROBLEMS OF DOMESTIC COKE PRODUCTION (IN HUNGARY). Peter, I.
[Michaux, Tap. (Smelting Rep.), Jan. 1932, 12-23]. Problems of coke production from Hungarian coals and lignites are discussed and a pilot washing and coking plant is described. The results of coking and briquetting tests are given.
