TITLE: Technique of studying the subsurface feeding of rivers in regions of widespread permafrost

SOURCE: Leningrad. Gosudarstvennyy gidrologicheskiy institut. Trudy, no. 133, 1966. Issledovaniya podzemnogo stoka v reki (Studies of subsurface flow into rivers), 74-81

TOPIC TAGS: hydrology, permafrost, <sup>under</sup>ground water, subsurface drainage, ~~river flow~~ surface water

ABSTRACT: Schemes are presented for the analysis of river-discharge hydrographs obtained for four seasons of the year at stations on several rivers in the permafrost areas of the Soviet Far East and Siberia. A review is given of the research results obtained by Soviet investigators studying the conditions which control the rate of interchange between surface and ground water. This interchange was found to be most extensive, not in areas where the permafrost is thinnest, but in areas which have been or are being subjected to structural deformations which pro-

duce access routes for water migration (deep-seated faults, complex jointing, fractured and intensely folded zones, and dikes). Recent epeirogenic movements also are processes which favor ground-water migration. The principal source of ground water in these regions generally is where high-pressure heads have been built up in such subpermafrost zones as the Irkutsk artesian basin, the Lena—Amur interfluvium, the Kama—Taseyeva region, and the Angara artesian basin. The development of naleds, especially those formed by water migrating into rivers from subpermafrost horizons, are analyzed in terms of their contribution to winter and summer feeding. Soil conditions and meteorological factors are also taken into consideration. Orig. art. has: 3 figures and 1 table. [W.A. 50]

Pihar, G.

The biochemistry of iodine. VII. Method to determine the activity of one characteristic deiodase. G. Pihar. *Ceopis Lihald Ceskych 90, 1935-2(1931)*.—A deiodase (I) was obtained from freshly decapitated white rats by perfusing the liver with a Ringer soln. of pH 7.4. Only from the thyroid the same I could be obtained. The I was assayed by taking 1 g. of the organ, grinding it with 3.5 ml. of 0.1M phosphate of pH 7.4, then adding 0.5 ml. of a diiodotyrosine (II) soln. (5 mg.), which also has a pH of 7.4, and 0.5 ml. 0.0001N KI; the control contains only 0.3 ml. of the KI. The mixt. was incubated for 1 hr. at 38°. After the incubation the controls received 0.5 ml. of II, the solns. were brought to 20 ml. with the (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>-CaSO<sub>4</sub> reagent, homogenized in a Potter-Elvehjem homogenizer, and filtered through a S & S filter paper of 10 cm. diam. The filtrate (17-18 ml.) was treated with AgNO<sub>3</sub>. The I was activated by urethan and cyanide, and was inhibited completely by dibromotyrosine in as low a concn. as  $1 \times 10^{-4}M$ . Fluorocysteine, tetrabromophyminic, and exts. from green leaves neither activated nor inhibited.

✓ *Bioturbation studies. IV. 4-Hydroxybenzo[*a*]pyrene, a new metabolite of benzo[*a*]pyrene. Otmár Pihár and Jiří Špalek (Charles Univ., Prague). *Chém. Zpr.* 56, 206-201(1956). cf. *C.A.* 46, 9087. — A  $\text{MgCO}_3$  ext. from feces of rats prepd. 24 hrs. after administration of an aq. suspension of benzo[*a*]pyrene (I) was partly evapd. the remainder extd. with  $\text{C}_6\text{H}_6$ , and the  $\text{C}_6\text{H}_6$  ext. chromatographed on  $\text{Al}_2\text{O}_3$ . After eluting I with  $\text{C}_6\text{H}_6$ , the azeo extg. benzopyrenoids was extd. from  $\text{Al}_2\text{O}_3$  with MeOH and methylated with  $\text{Me}_2\text{SO}$  (II) in the presence of excess NaOH and powd. Zn. The  $\text{C}_6\text{H}_6$  ext. of the mixt. was evapd. and the residue chromatographed on  $\text{Al}_2\text{O}_3$ , yielding with ligroin 6-methoxybenzo[*a*]pyrene (III) and 8-methoxybenzo[*a*]pyrene, besides 2 unidentified compts. No quinones were present. III was identified by its absorption spectrum in comparison with that of synthetic III which was obtained by treating 6-acetoxybenzo[*a*]pyrene (cf. *C.A.* 33, 574<sup>a</sup>) with 5 portions of II and NaOH during 4.5 hrs. After decomp. II by boiling and removing MeOH *in vacuo*, the mixt. was extd. with  $\text{C}_6\text{H}_6$  and the ext. chromatographed on  $\text{Al}_2\text{O}_3$ , yielding III, m. 174.5-5° (from ligroin- $\text{C}_6\text{H}_6$ ). Transformation of I to 6-hydroxybenzo[*a*]pyrene cannot be explained by the "autohydroxylation" hypothesis (cf. *C.A.* 34, 7900; *C.A.* 41, 1704) but is more probably due to direct oxidation in the position 6 of the I mol, suggesting the presence in the organism of systems possessing powerful oxidative faculty. Pihar, O

✓ Biooxidation studies. V. Cooxidation of 3,4-benzopyrene by cytochrome oxidase. Otomar Pihar (Charles Univ., Prague). *Chem. Listy* 50, 1137-38 (1956); *C.A.* 50, 7707c. — In a system of cytochrome oxidase (I) with low concns. of cytochrome c (II) and in the presence of reducing agents, benzopyrene (III) is cooxidized in the course of the reaction to hydroxybenzopyrenes and benzopyrene quinones. The cooxidation of III is accompanied by seeming activation of I which occurs only when cooxidation occurs at the same time. Oxidation products of III are formed only in a narrow concn. range of II (approx.  $3 \times 10^{-7}M$ ); no cooxidation was noticed at higher concns. of II, or without II. A condition required by the oxidation is that the rate of the reduction of I at full satn. with II be reduced to 1/10. The cooxidation of III supports the hypothesis that the reduction of O to H<sub>2</sub>O occurs in a complex with I by successive one-electron reactions according to the theory of Michaelis. Incompletely reduced radicals are supposed to be intermediates if the reduction of I is slow enough which is the case in biol. tissues. M. Hudlický

MD Resistance of benzo(a)pyrene against digestive juices of the human organism. J. Charvát and O. Pihar (Charles Univ., Prague). *Ceskoslov. Onkologie* 2, 263-7 (1955).-- Expts. including incubation of benzo(a)pyrene (1) solns. with saliva, gastric, and duodenal juices at 38° showed that these secretions do not effect an oxidative inactivation of 1 *in vitro* and cannot account for the protective properties of the organism against carcinogenic influence of 1 present in food. L. J. Urbánek

Pihaj, O.

✓ Enzymic oxidation of benzo[a]pyrene *in vitro*. O. Pihaj and L. Dupalová (Charles Univ., Prague). *Ceskoslov. Onkologia* 2, 295-305 (1955).--Manometric expts. in the Warburg app. at 38° showed that benzo[a]pyrene (I) was oxidized to phenols and quinones at low concns. of cytochrome c ( $3 \cdot 7 \times 10^{-4}$ ) in the presence of cytochrome oxidase (II) and reducing substances; the main reaction products, 5,8- and 5,10-benzopyrene quinones, were isolated. The oxidation did not proceed with any single component of the system nor with any other combination and was coupled with O consumption. The oxidation of I in this system was explained on the basis of peroxide effects of incompletely reduced forms of O when there is a slow reduction of II. In the tissues II is reduced at a substantially slower rate than that corresponding to its activity at full satn. with cytochrome c. The products of oxidation of I *in vivo* were identical with compda. isolated as metabolites *in vivo*. Therefore, the assumption that II also takes part in the inactivation of I in the tissues appears plausible. L. J. Urbánek

PIHAR O. Ze Socialne Zdravotnicke Poradny pro Choroby Zlaz s Vnitřni Sekreci a ze III. Interni Kliniky. Rychla mikromethoda stanoveni dusiku v moci A rapid micro-method for estimation of nitrogen in the urine Casopis Lekarů Ceskych 1949, 88/5 (127-128)

The nitrogen compounds in urine are oxidized with alkaline bromine solution and the remaining bromine is determined fotocolorimetrically, using a green filter (530 mμ.) Fifty analyses can be made within one hour. Comparing the results with those of the Kjeldahl method the described method appears to be satisfactory.

3171. New enzymological methods. I. Photometric determination of the cytochrome oxidase activity. O. Pihar (*Chem. Listy*, 1953, 47, 1511-1515).—Two rapid photometric methods for the determination of the activity of cytochrome oxidase saturated with cytochrome-c are described; they are based on the oxidation of 3,5-dichlorophenolindophenol (I) and of *p*-phenylenediamine (II) to coloured products. The latter method is more broadly applicable, giving reliable results even with homogenates from the kidney and heart of the rat, whilst the former method cannot be applied to samples containing reducing components. *Procedure*.—To the enzyme preparation (0.1 ml) add 0.0001 M cytochrome-c (0.3 ml) and 0.1 M phosphate buffer (pH 7.5) (2.1 ml), followed by a soln. of I (0.5 ml), prepared by reducing 0.0005 M dichlorophenolindophenol with sodium amalgam. Measure the extinction at 610 m $\mu$  in 20-sec. intervals during 3 min. The apparent activity of a control experiment, in which the soln. contains in addition to the same system, 0.01 ml of 0.033 M NaCN (added before I), must be subtracted. Similarly, measure the extinction at 340 m $\mu$  of a system containing 0.1 M phosphate buffer (pH 7.5) (1 ml), 0.3 per cent. fresh aq. II (3 ml), the enzyme preparation (0.1 ml) and 0.0002 M cytochrome-c (0.3 ml). G. GLASSER

Pihar O

3164. Determination of thiol groups in human albumin and in plasma. O. Pihar (*Acta. Lity.*, 1953, 47, 1852-1858).—The method in which sodium chloromercuribenzoate (I) is added to a soln. of a protein and the excess of I is determined by potentiometric titration with cysteine (*Anal. Abstr.*, 1955, 2, 3163), has been applied to the study of the thiol-group content of human serum albumin and of plasma. It is concluded that no free thiol groups occur in native human serum albumin but that, owing to the denaturing effect of I in concn.  $> 0.00045 M$ , the formation of 0.8 mole of thiol groups per mole of albumin becomes evident. To determine thiol groups in plasma, centrifuge a mixture of blood (0.2 ml) and physiological salt soln. (1.8 ml), add the diluted plasma (1.5 ml) to a mixture of 0.0005 M I (1 ml) and 0.1 M  $Na_2HPO_4$  (4.5 ml), and titrate the excess of I potentiometrically with 0.0008 M cysteine, a silver electrode being used.

Effect of detergents on the cytochrome system. Otomar Pihar (Státní fak. nemocnice, Prague, Czech.). *ČASOPIS LÉKÁRŮ*, 1401-8(1953).—The inhibition of succinodhydrogenase and succinoxidase by salicylate, linolate, and cholic acid depends on the denaturing activities of these compds. A new type of inhibition was found with malonate. The inhibition of succinodhydrogenase is explained by the combined action of the polar and nonpolar part of the detergent mol., and the degree of the activity depends on the strength of the anionic group and on the affinity of the hydrophobic part of detergent to hydrophobic parts of the protein mole. in the cytochrome system. The inhibition of succinodhydrogenase depends only on the degree of denaturation of the enzyme, whereas with succinoxidase, the denaturing of the carrier of the multi-enzyme unit also plays a part even when individual enzyme components keep their high activity. M. Hudlický

New methods in enzymology. I. Photometric determination of cytochrome oxidase activity. Otomar Pihar (Státní fak. nemocnice, Prague, Czech.). *ČMn. Lidy* 47, 1511-15 (1953).—Two rapid photometric methods for the determination of the activity of cytochrome oxidase satd. with cytochrome c are based on the oxidation of leuco dichloroindophenol (I) and of  $p\text{-NH}_2\text{C}_6\text{H}_4\text{NH}_2$  (II), resp. Whereas I can be applied only to systems free from reducing components, II gives reliable results even with rat kidney and heart homogenates. One half ml. of a soln. of I prepd. by reducing 0.0005*N* dichloroindophenol with NaHg is added to 0.1 ml. enzyme prepn., 0.3 ml. 0.0001*M* cytochrome c, and 2.1 ml. 0.1*M* phosphate buffer (pH 7.3), and the change of extinction is measured for 3 min. at 30-sec. intervals. Similarly, measurements of extinction at 640 m $\mu$  are made with a system contg. 1 ml. 0.1*M* phosphate buffer (pH 7.3), 3 ml. 0.2% aq. II, 0.1 ml. enzyme prepn., and 0.3 ml. 0.0002*M* cytochrome c. II. Photometric determination of xanthine oxidase activity. Otomar Pihar and Karel Fischer (Ústřední endokrinní ústav, Prague, Czech.). *Ibid.* 1862-4.—A rapid method for the detn. of the xanthine oxidase (D) activity is based on the measurements of the extinction of solns. of I with dichloroindophenol (II). The measurements are carried out in a system contg. 1 ml. enzyme soln., 0.3 ml. 0.0005 II, 0.85 ml. 0.05*M*  $\text{Na}_2\text{HPO}_4$  (pH 7.3), 0.45 ml. 0.1*M*  $\text{KH}_2\text{PO}_4$ , 0.1 ml. 0.03*M* NaCN, and 0.005*M* xanthine in 0.1*N* NaOH. The resulting pH is 6.9, the extinction is measured at 610 m $\mu$  at 30-sec. intervals. M. Hudlický

The biochemistry of iodine. VIII. Question of the presence of xanthine oxidase in the thyroid gland. Otonar Pihar (Centr. endocrin. inst., Prague, Czech.). *Časopis lékař. českých* 91, 833-7(1983)(in Czech); cf. *C.A.* 48, 11589. — In homogenates prepd. from thyroid an inhibitor of xanthine oxidase (I) was demonstrated which is responsible for the unreliability of the detn. of I in thyroid. The presence of flavine adenine dinucleotide (demonstrated by paper chromatography) and a weak activity of thyroid homogenates to oxidise salicylaldehyde indicate, however, that there is a small amt. of I present. The inhibitor is inactivated during incubation with liver homogenates or with I. It may be identical with some substrate of I. Methylthiouracil at a concn. of  $10^{-3}M$  had no effect on I activity.

### CZECH

Reaction of benzopyrene with the thiol groups of succinate dehydrogenase. Otomar Pihar, *Českoslov. Ondol.* 1, 97-102 (1984). Succinate dehydrogenase (II) in glycerol added in  $\gamma$  quantities to an enzyme prepn. from beef heart contg. the cytochrome system in which the activity of succinate dehydrogenase (II) is inhibited by I acting as acceptor. Studies of the dependence of II activity on the concn. of chloromercuribenzoate (III) revealed that a part of the thiol groups that are necessary for the full activity of II is considerably more sensitive to III than was believed. In the concn. region of III where a part of the most reactive thiol groups remains free, an accessory inhibition of II by I takes place. After a complete elimination of this type of thiol groups by III, the inhibitory effect of I was not shown. This implies that for the inhibition of II by I those particular thiol groups are indispensable which are the most reactive towards III. Polarometric titration of thiol groups of the enzyme prepn. revealed that a small part of the demonstrable thiol groups disappears through the action of I. Possible cause of the decrease of SH groups and of the inhibition of II is discussed and the possible effect of some oxidation product of I arising by the action of some enzyme present in the prepn. used is pointed out.

PIHAR, Otomar

Blood serum level of succinic acid in diseases of the liver and of the extrahepatic bile ducts. Zdenka Marešová, Otomar Pihar, and Jirí Šonka (Charles Univ., Prague, *Časopis lékařů českých* *Lilij* 9, 140-51(1984).--Results of clinical studies with 48 patients are reported. A relation between the serum level of succinic acid (I) and the extent of damage to the liver parenchyma was ascertained. The level of I in diseases of extrahepatic bile ducts in a posthepatic syndrome and in compensated cirrhoses of various etiologies did not exceed the value of 10  $\gamma$ /0.1 ml. Values above this level prove various degrees of liver insufficiency from a minor grade of liver impairment to serious metabolic disorders. L. J. Urbánek

PIHAR, O.

180. New methods in enzymology. III. Polarographic determination of cytochrome oxidase and succinic oxidase activities. O. Pihar and L. Dupalova (Chem. Listy, 1954, 48 [2], 285-271).—A rapid polarographic determination of the activity of cytochrome oxidase (I) is based on the decrease of the peroxidic wave at 1.1 V with the dropping-mercury electrode. The activity of I was measured in the system oxidase-cytochrome-c (II)-*p*-phenylenediamine (III). In the presence of III only a small part of II is reduced. The concn. of ferrocytochrome (IV) was calculated from the concn. of II and III and normal potentials of both redox systems. The dependence of the activity of I on the actual concn. of IV is similar to that in the manometric determination with ascorbic acid. The polarographically obtained values of the activities of I and succinic oxidase in various organs of rats are compared with those obtained by other methods.

CZECH

Catalytic oxidation of ascorbate in the presence of o-iodophenols. Otomar Pihar (Ústřední endokrinní ústav, Prague). *Chem. Abstr.* 49:360-61(1955). cf. preceding abstr. Ferron (I) is a strong activator of autoxidation of Na ascorbate with O. The autoxidation of ascorbate is accelerated also by diiodotyrosine and thyroxine, and the catalysis is inhibited by cytochrome c, by catalase, by pyruvate, and by Ca hydroxide. The catalytic properties are probably due to the o-iodophenolic group. In the proposed mechanism of the ferron catalysis the carrier of the catalytic chain is probably the phenolate anion of I. I was found to catalyze also the decomposition of H<sub>2</sub>O<sub>2</sub>. M. Hudlický

PIHAR, OTOMAR

CZECH

Activation of cytochrome oxidase by ferron. Otomar Pihar and Miloš Čihák (Ústřední endokrinní ústav, Prague). *Cytochrome* 14: 49, 352-8(1966); cf. preceding abstr.—Cytochrome oxidase and reduced cytochrome c as H donor is a system activated by ferron (I). Activation occurs at concns. of I of  $10^{-11}M$  whereas the activation of succinic dehydrogenase with cytochrome c as H acceptor occurs at concns. of I of  $10^{-11}M$ . A direct reaction of I with the factors of the enzyme system was not observed. The activation of cytochrome oxidase may be explained by formation of a semiquinone radical of I by the reaction with incompletely reduced forms of O, and by the carrier function of the oxidation-reduction system ferron-semiquinone.

Abstract: The ecological conditions (chiefly soil) of cutting on the felled wood soils in Estonia were studied during 1972-1975 for the purpose of ascertaining the feasibility of eliminating factors preventing the successful reforestation of unexploited cuttings in the north and northwest of the Estonian ASSR. It was determined that these (former) soils are

rich in humus and are characterized by a considerable loss of nutrients. The chief reasons for the failure of the cultures in such soils in the cut areas are as follows: The stripping of the seedlings, the extreme drying of the thin soil layer in draughty seasons, especially in the preparation of the soil by sections and abrupt fluctuations of the soil surface temperature during increasing the ability of the plantings to take root (Generally, a swing in the principal measure for increasing the ability of the soil layer to take root (generally, a swing in the soil layer under the seedlings either by planting in turned-over soil or in heated soil). The 2-year seedlings are the most satisfactory ones for culture

TITLE: A method for determining the optimum parameters of marine nuclear power plants

131

SOURCE: Danzig. Politechnika. Zeszyty naukowe, no. 72, 1965. Budownictwo okretowe, no. 7. Prace Instytutu Okretowego, 131-190

TOPIC TAGS: nuclear power plant, marine engine, nuclear powered ship, nuclear reactor coolant

ABSTRACT: A method for determining the optimum parameters of marine nuclear power plants is presented. It consists of finding the optimum pressure and temperature of the coolant and working fluid for a given marine power-plant capacity and reactor type. The effect of the temperature characteristics of the reactor core on the performance is analyzed from the physical point of view, and relations are obtained for the effect of the core temperature on the reactor's main parameters. Equations are given for determining the heat output and the maximum metal temperature of a marine nuclear power plant under given design and material conditions. Ink transfer to paper in print. I. (31). (Svensk Papp Tidn 1952, 64, 358-362) In a study of the ink transfer at the moment of impression and the subsequent absorption of the ink by the paper the general differences in ink transfer between various kinds of paper were observed. An ink distribution number is defined as  $v = s/(g - s)$  (where there are  $g$  ml. of ink per sq. m. on the forms, of which  $s$  ml. per sq. m. are transferred to the paper) and gives a good indication of the ink transfer to papers for different amounts of ink

on the forms under constant printing conditions. The ink distribution when printing various papers was determined experimentally. S. V. SARGENT.

TITLE: Saddle-Type Automobile Prime Mover for Transportation of Lumber

PERIODICAL: Mekhanizatsiya i avtomatizatsiya proizvodstva, 1959, Nr. 9, pp 41-48 (USSR)

ABSTRACT: Automobile transport occupies first place in the lumber industry among all the other transportation facilities. The basic factors on which efficiency of auto-transport depends are: the load volume, speed of auto-train movement, and the length of demurrage under loading and unloading. The Institute of Designs "Giprolestrans" has been researching, of late, the possibilities of a maximum increase in efficiency of automobiles ZIL-150 and ZIL-151 with an applied load not over 6-6.5 tons per axle. In order to increase the carrying capacity of these automobiles, it is necessary to augment the number of bearing axles in the automobile rolling stock, because the average moving speeds of auto-trains are relatively stable, amounting to

16-20 km/hour without a load, and 15-18 km/hour when loaded, and cannot influence the operating conditions. The time required for unloading of timber at lower lumber yards amounts, after mechanization, to 8-10 minutes, while demurrage at upper yards, due to introduction of loading in large lots, is also considerably diminished. Fig. 1 shows different types of auto-trains with wheeled trailers applied for transportation of logs. The trains 1-a and 1-b consist of an automobile prime mover provided with a cabin and two trailers either single-axle or two-axle type. The saddle coupling device between the mover and the first trailer ensures a quick clutching or disconnecting of the mover from the train; it enables using the mover for other operations while the trailers are loaded. The most widely used at the present time are auto-trains, Types 1-v and 1-g, consisting of a mover and a two-axle or a single-axle trailed chassis; however, this type of rolling stock not being equipped with a saddle-

coupling, does not permit disconnecting of the mover during the loading of lumber. As is seen from Graph 2 the best performance is ensured by auto-trains of Types 1-a and 1-b, it attains its maximum value at transportation distances of 10-15-20 km, and considerably diminishes it at distances of 30-40 km. In 1958, the Novgorodskiy Repair-Mechanical Plant produced, for the first time, a saddle type automobile prime mover with two driving axles. Construction of this mover has been worked out by the "Giprolestrans", the mover is intended to be used in compositions of Types 1-a and 1-b. In Graph 4 it is shown that the traction force of the new mover is superior to those automobiles ZIL-151, MMZ-584 and even ZIL-151. In order to surmount the difficulties connected with deliveries of saddle-type clutching devices produced by other plants, the "Giprolestrans" has constructed a coupling that can be manufactured in local workshops of lumber enterprises (Fig. 5). In 1958, two movers equipped with saddle-clutches were tested at the Lodynopol'skiy Lumber Industry Eco-

nomy. The results were as follows. The driver Filipov, on auto-mover Nr 1 that was put in operation on June 11, 1958, has made, up to March 1, 1959, 422 trips, each one of 15-18 km; he transported 5560 m<sup>3</sup> of wood, having covered 14,458 km. The driver Burkov, on auto-mover Nr. 2 that was put in operation on August 19, 1958, has made 300 trips; he transported 4052 m<sup>3</sup> of wood, having covered 10,943 km. Results of the operation of these two movers for January-February 1959 are given in Table reproduced on page 48. In conclusion, it is to be noted that the movers of described type can be used not only in lumber industry; they can be successfully applied also to the transportation of pipes and other loads having considerable lengths. There are 2 graphs, 1 table and 5 diagrams.
