1 - F/W

In the Vitali theorem demonstrated in this note, the basic set M is covered by a family of closed sets F such that, for each $\epsilon > 0$, each element P of M belongs to a set F with $|F| < \epsilon$ ($|F|$ = measure of F) and to every F there exists one of a set of parallelepipeds A such that $|F|/|A(F)| > \theta$, θ independent of F , the parallelepipeds A being regular in the sense that the ratio of the lengths of any two edges is between k and $1/k$, k fixed.

~~Pocnaru, Valentin. Propriétés métriques des congruences.~~
 Com. Acad. R. P. Rouine 5 (1955), 295-301. (Romanian. Russian and French summaries)
 MS Using results of the paper reviewed above, the author studies some metric properties of such congruences. Let E be a measurable plane set, let $y=f(x, t)$, where the parameter t is the ordinate y_0 at $x=0$, and let $E(t)$ be the projection on the x -axis of the intersection of $y=f(x, t)$ with E . The measure of $E(t)$ is then studied as a function of t . The main result of the paper seems to be the following statement: Let $y=f(x)+t$, where $f(x)$ is a continuous function. Let $F(x, y)$ be summable and vanish outside the domain D bound by $x=a, x=b, y=f(x)+t_0, y=f(x)+T$. Then $F(x, y(x)+t)$ is summable for almost all t and $\iint_D F dx dy = \int_{t_0}^T dt \int_a^b F(x, y(x)+t) dx$. The reviewer does not see why this result should not follow directly from Fubini's theorem, nor why F is required to vanish outside D .

Let y be a solution of a linear, homogeneous differential equation with real coefficients and let x_1, x_2 be two real roots of $y(x)$. De La Vallée Poussin has shown [J. Math. Pures Appl. (2), 8 (1929), 125-144] that there exists a constant h , depending only on the coefficients of the differential equation, such that $x_1 - x_2 < h$ implies $y(x) = 0$. The author studies the particular case of the second-order differential equation $y'' + A(x)y = 0$, with $A(x)$ a continuous function. He indicates an algorithm for the computation of h with any desired accuracy. The method consists in proving first that h is a continuous functional with respect to $A(x)$. This permits one to approximate $A(x)$ uniformly over the closed interval (a, b) , by its sequence of Bernstein polynomials and to approximate two independent solutions also by polynomials of two sequences, $P_k(x)$ and $Q_k(x)$. For a given h , the least distance between consecutive zeros of $y(x) = C_1 P_k(x) + C_2 Q_k(x)$ is the common root h of.

$$\frac{P_k(x+h)}{Q_k(x+h)} = \frac{P_k(x)}{Q_k(x)}$$

and of

$$\frac{d}{dx} \left\{ \frac{P_k(x+h)}{Q_k(x+h)} \right\} = \frac{d}{dx} \left\{ \frac{P_k(x)}{Q_k(x)} \right\}$$

1
2

FOIAS, CITRAN; GOSS, GEORGE
Eliminating x , one obtains an equation in h ; its smallest root r such that the root x of $y(x)$ and $x+r$ both belong to (a, b) is then taken as the approximation h_2 of h . A very detailed investigation is made, in order to ascertain that the value h_2 so obtained satisfies $|h-h_2| < \epsilon$, with any preassigned $\epsilon > 0$. It is asserted (following Joukowski) that if $A(x)$ is periodic, of period ω , the solutions of the differential equation stay bounded at infinity, provided that $\omega < h$.

in Mines

022.673 6

„Problem trwałości lin stalowych w górnictwie”. Przegląd Górniczy. No. 3, 1951, pp. 90—96, 12 figs.

The brevity of the life of winding ropes is due to faulty manufacture in the various phases of the technological process, and especially in the heat-treatment of wires, to an inaccurate choice of rope construction for given conditions, to defects in or the bad condition of some parts of the installation connected with the work performed by rope, to mistakes made while changing the ropes, to their increased number of winding in the time unit, and finally to unsatisfactory maintenance during the operation. Analysis of factor groups influencing the durability of ropes, such as: 1) quality of raw material, 2) manufacturing of steel wire and of rope, 3) use of ropes.

Dyes and Textile Chemistry

1 The synthesis of organic dyes. Igor Belic, Zora Gabrijelcic, Metod Pogacnik, Vladimir Premry, Ivo Stokovic, Milhailo Zisic, Golko Zupan, and Vlado Zupan (Inst. Ind. Research, Ljubljana). *Kem. Zbornik* 1951, 128-33.

The synthesis of many dyes used in the textile and other industries is discussed. Brief descriptions of the synthesis are given for the following dyes: (1) sulfate black; benzene is chlorinated to produce monochlorobenzene which is then nitrated to produce 1-chloro-2,4-dinitrobenzene. This is converted to 2,4-dinitrophenol by heating with NaOH. The 2,4-dinitrophenol is heated with a soln. of polysulfide and the product, upon oxidation in air, gives the sulfate black dye. This method has been used on a semi-industrial scale to produce 10-ton amts. of the dye. (2) Sulfate blue; chlorobenzene is nitrated to give a mixt. of *o*- and *p*-nitrochlorobenzene. The latter is treated with NaOH soln. in an autoclave at 6-7 atm. pressure to give nitrophenol. This is reduced in the presence of Fe in a salt (NaCl) soln. to give *p*-aminophenol which is condensed with 1-chloro-2,4-dinitrobenzene to give 2,4-dinitro-4'-hydroxydiphenylamine. Heating this product with a soln. of Na₂S, in various concns. and under different conditions followed by oxidation gives 2 blue dyes of different identity. (3) Sulfate brown; naphthalene is nitrated to give mononitronaphthalene which is further nitrated to produce a mixt. of 1,5- and 1,8-dinitronaphthalene which is then heated in a rotating Fe drum with Na₂S and S to produce the dye. (4) Hydron Olive dye; anthracene is heated in a rotating drum with S. The product is extd. with Na₂S, to produce the dye. (5) Chrome blue and chrome black for wool; a soln. of 2-naphthol is treated with a soln. of

2/2 Igor Belic, etc. (9)

NaNO_2 in H_2SO_4 to produce 1-nitroso-2-naphthol, which upon the addn. of NaHSO_4 and H_2SO_4 gives 1-amino-2-naphthol-4-sulfonic acid. This is then subjected to the diazo reaction to form 1-diazo-2-naphthol-4-sulfonic acid. The Na salt of this acid is treated with a soln. of the Na salt of 2-naphthol. This produces a dark blue dye. (8) Nigrosine; this dye is prepd. by heating $\text{PhNH}_2 \cdot \text{HCl}$ with PhNO_2 and treating the reaction product with NaOH . The syntheses of azo dyes and of indanthrene dyes are also discussed.

AUTHOR: Pogadayev, I. K.

TITLE: Design of frames for free vibrations by the method of successive approximations

PERIODICAL: Referativnyy zhurnal, Mekhanika, no. 3, 1963, 17-18, abstract 3V156 (Izv. vyssh. uchebn. zaved. Str-vo i arkhitekt., 1962, no. 3, 50-58)

TEXT: The author considers free and constrained frames with rectilinear elements of constant flexural rigidity and with mass uniformly distributed along the rods. The method of displacements is adequate. The deflection function is represented in the form

$$y(x,t) = \sum_{k=1}^n z_k(t)y_k(x)$$

Card 1/3

Design of frames ...

S/124/63/000/003/044/065
D234/D308

where $y_k(x)$ for each rod must satisfy the differential equation of free vibrations

$$y_k^{IV}(x) - \frac{u^4}{l^4} y_k(x) = 0$$

$$u^4 = l^4 \frac{m\omega^2}{EI}$$

and the boundary conditions. Taking an approximate value of the unknown frequency $\bar{\omega}$ (or of the frequency parameter \bar{u}) the deformed state of the system is defined by n coordinates $Z_k(t)$ which are the displacements of the knots of the system. The given system with infinite degrees of freedom then reduces to one with a finite number of degrees of freedom. $Z_k(t)$ is sought in the form $Z_k(t) =$

Card 2/3

S/124/63/000/003/044/065
D234/D308

Design of frames ...

 $= z_k \sin(\omega t + \alpha)$, which leads to a frequency equation

$$|R - \lambda T| = 0, \lambda = \frac{\omega^2}{\bar{\omega}^2} - 1$$

where R and T are matrices whose elements are r_{ik} (reactions of the method of displacements) and t_{ik} . These quantities are determined from formulas deduced in the paper, whose use is simplified by tables. The transcendental frequency equation is replaced by an algebraic one. Numerical examples illustrate the methods of application of successive approximations which make it possible to determine the frequency with a degree of accuracy. / Abstracter's note: Complete translation. /

AUTHOR: Kozlova, Yu. S.; Pogadayeva, A. A.; Rogovin, Z. A.

TITLE: Synthesis of new derivatives of cellulose and other polysaccharides. XXVIII.
Synthesis of grafted cellulose copolymers with polyacrylic and polymethacrylic acids

SOURCE: Tsellyuloza i yeye proizvodny*ye, sbornik statey (Cellulose and its derivatives)
Moscow, 1963, 3-7

TOPIC TAGS: polysaccharide, cellulose, cellulose fiber, cellulose copolymer, grafted
polymer, polymer brittleness, synthetic fabric

ABSTRACT: While searching for cellulose fibers with improved properties (particularly dyeing with basic dyestuffs and resistance to microorganisms), the authors prepared a variety of copolymers, defined their composition and examined their properties. Of the two methods of synthesis tested, first, a basic polymerization of acrylic and methacrylic acids in the presence of cellulose with ammonium persulfate as the initiator, and second, a macroradical procedure after introduction of an aromatic amino-radical into the cellulose macromolecule followed by diazotization - the latter proved more adequate. The amount and the chain length of the polymer grafted into the cellulose were found to depend on the number of active centers in the cellulose macromolecule, the monomer

1/2

Card

ACCESSION NR: AT4017405

concentration in the solution, the temperature and duration of the reaction, and the nature of the monomer used. The grafted polymer yield may be brought up to 50-60% of the initial cellulose weight by expediently combining the conditions. However, it is not advisable to exceed a carboxyl group of 12-15% content because of the increasing brittleness of the product with a higher carboxyl content. The products obtained dye well and readily absorb moisture. A cellulose fabric containing grafted copolymers of this type shows increased resistance to microorganisms and readily exchanges cations. The synthetic procedure is given in detail. "A. Ya. Korotkova took part in the work. The cellulose fiber was treated by A. S. Kuznetsova in the Mikrobiologicheskaya laboratoriya TsNII LV (Microbiology Laboratory)." Orig. art. has: 3 tables.

3398. SERUM PROTEIN FRACTIONS IN THE INSULIN THERAPY OF THE MENTALLY SICK - Bielikovinové frakcie krvného séra pri liečbe duševne chorých inzulínom - *Pogády J. and Molcan J. Psychiat. Klin. Lek. Fak. UK, Bratislava - CSL. PSYCHIAT. 1958, 44/3 (154-158)*

Neither during subcoma nor during coma, according to Himwich's classification, were there any marked changes of the individual serum protein fractions. The time course of the insulin hypoglycaemia provides more accurate information as regards shifts of the protein fractions than evaluations based on clinical symptoms. The α_1 -fractions rise during the first hour after the administration of insulin and decrease during the 4th hr. Five hr. after the administration of insulin the albumins rise significantly and all globulin fractions decrease.

TITLE: Chlorides in cerebrospinal fluid of patients suffering from psychiatric diseases

SOURCE: Ceskoslovenska psychiatrie, no. 3, 1965, 156-163

TOPIC TAGS: chloride, central nervous system, psychiatry, brain, psychoneurotic disorder, psychopathology

ABSTRACT:

The content of chlorides in the cerebrospinal fluid of 2098 persons was evaluated statistically; of the total, 928 were mentally ill and 1170 suffered from inflammatory diseases of the brain. The content of chlorides in different forms of meningoencephalitis is significantly lower than in meningitis tuberculosa. Patients who suffer from neurotic depressive reactions and epilepsy had lower chloride values than those suffering from psychopathies, and incipient, latent and tardive forms of neurolues. People with psychoneurotic disturbances, hysterical reactions, endogenous psychoses, oligophrenias, and alcoholism had lower chloride values, between 720 - 740 mg%. No connection between the con-

"Sensory Deprivation and Some Problems of Clinical Psychiatry."

Prague, Casopis Lekarů Ceskych, Vol 105, No 32, 15 Aug 66, pp 869 - 870

Abstract: Formation and restoration of conditioned reflexes after an isolation depriving the animal of light, acoustic impulses, and locomotor reduction and social isolation were investigated in rats. Sensory deprivation and locomotor reduction have differing effects on the processes of learning and memory; the first enhances it, the second slows it down significantly. In sensory deprivation there is a difference between an individual or a group exposure. Importance of these facts in clinical psychiatry is discussed. 2 Figures, 1 Table, no references.

"Histochemical Determination of Glycogen and Sulfhydryl Groups in Some Model Inhibitory Conditions."

Prague, Ceskoslovenska Psychiatrie, Vol 62, No 6, Dec 66, pp 369-373

Abstract [Authors' English summary modified]: Glycogen in the nervous cells is very stable; it is very difficult to induce changes in its retention by the action of drugs. Insulin coma is not caused by a lack of glycogen in brain tissue, but by other functional reasons. Sulfhydryl groups can serve as an indicator of respiration of brain tissue; they do not show any changes due to action of insulin. 2 Figures, 4 Western, 1 Czech, 3 Russian references. SOURCE: Ceskoslovenska psychiatrie, no. 5, 1965, 289-297

TOPIC TAGS: nervous system disease, protein, infective disease, psychoneurotic disorder

ABSTRACT: Laboratory data on cerebrospinal fluid analysis in 2408 psychiatric patients, including 1301 with infectious or inflammatory cerebrospinal diseases; in the latter patients, both total reducing substances and total proteins were markedly increased; in other psychiatric patients, it was less pronounced although definitely present; the difference between inflammatory and mental cases was significant statistically. CP

Methods of obtaining absorption spectra. (Preliminary note.) P. Pogăncanu and H. Tintea. *Bull. sci. acad. roumaine* 20, No. 1-3, 46-7 (1978).—With a Baly tube to vary the thickness and 0.0001, 0.0001, and 0.00001 *N* solns. in heptane, with a quartz spectrograph and an Al spark under water as source, the following peaks of absorption bands were detd. by the Hartley-Baly method and the plates studied with a microscope and enlarged projection: *pyrene* 3831, 3778, 3710, 3650, 3620, 3572, 3510, 3441, 3340, 3301, 3101, 3130, 3056, 2930, 2731, 2690, 2622, 2513, 2408 Å.; *anthracene* 3958, 3754, 3701, 3500, 3516, 3304, 3348, 3230, 3198, 3090, 2965, 2520 Å.; *9,10-dichloroanthracene* 4020, 3957, 3863, 3750, 3607, 3558, 3428, 3263, 3117, 2908, 2512 Å.; *9,10-dibromoanthracene* 4032, 3810, 3614, 3430, 3272, 3131, 2900, 2507 Å. H. Tintea and P. Pogăncanu. *Ibid.* No. 4-5, 96-9.—The extinction curves of anthracene (I) and pyrene (II) obtained with a Loewe-Scheibe spectro-photometer by use of a condensed spark between W electrodes are given. The wave lengths of the max. are: I, 3760, 3700, 3570, 3510, 3394, 3350, 3238, 3185, 3100 Å.; II, 3720, 3658, 3620, 3570, 3510, 3445, 3352, 3300, 3194, 3135, 3090, 2940, 2730, 2602, 2624, 2520 Å. Fewer bands are detected and the max. are displaced toward the visible from the max. obtained by the Hartley-Baly method. The Hartley spectrograms are reproduced. The Hartley-Baly method appears to be more precise (error = 1 Å. for $\lambda < 3000$ Å., = 2 Å. for $\lambda > 3000$ Å.) than the Scheibe method (≈ 3 Å. and 5 Å., resp.) in detg. the position of the band. It is less laborious and allows more bands.

Janet E. Austin

ASB-514 METALLURGICAL LITERATURE CLASSIFICATION

Absorption spectra by the Hartley-Baly method of several hydrocarbons of condensed benzene nuclei: anthracene, pyrene, naphthacene, perylene. P. FOSAYRAGE (Bull. Acad. Sci. Roumaine, 1958, 20, 34-36).—The absorption spectra of anthracene, pyrene, and naphthacene in EtOH solution, and perylene (I) in both EtOH and $n\text{-C}_7\text{H}_{16}$ solution, have been examined from 6000 to 2100 Å. For each substance 4 concns. (10^{-3} , 10^{-4} , 10^{-5} , and $10^{-6}\%$) and 15 thicknesses (between 10 and 100 mm.) were used. The absorption curves and the $\lambda\lambda$ of the absorption max. are given. The spectra of (I) in EtOH and $n\text{-C}_7\text{H}_{16}$ are similar but the absorption max. are displaced to longer $\lambda\lambda$ in the latter solvent. W. R. A.

ASR 51A METALLURGICAL LITERATURE CLASSIFICATION

PROCESSES AND PROPERTIES INDEX

17.1

AC

Methods of obtaining absorption spectra. P. PONDURANU and H. TINTA (Bull. Acad. Sci. Roumaine, 1939, 20, 66-67).—Extinction coeff. determinations are unnecessary for most chemical purposes, as measurement of the λ of the absorption max. by the Hartley-Bally method is adequate. Data obtained by this method (2100-6000 Å.) are recorded for pyrene, anthracene, and 9:10-dichloro- and -dibromo-anthracene. A. J. E. W.
