

L 22525-65

ACCESSION NR: AP5001552

An analysis of the available experimental data shows that the decrease in conversion efficiency with increase in wavelength is due to the inertia of the electrons, and that a high-frequency spark discharge can not generate an appreciable amount of microwave harmonic power. Orig. art. has: 3 figures, 2 formulas, and 1 table.

"Phytobenthos of the Dnepr Estuary".

Tr In-ta Gidrobiol AN SSSR, No 31, 1953, pp 154-189.

Detailed characteristics of the flora composition , of the plant group composition, of the dimensions of the biological mass, and of the seasonal development of water plants are given. The vegetation differs according to the character of the water: 1. Western part of the estuary— the group Cladophora glomerata including many species of green algae, (Cladophora gracillis, Enteromorpha compressa, E. Intestinalis, Spirogyra sp. sp., Spirulina, etc.), and diatomous algae, predominates. 2. Middle part of the estuary--the compostion of the vegetation is the same in general, but the marine form is encountered less frequently. 3. Eastern part of the estuary—the muddy-sandy part is occupied by the group Vallisneria spiralis-Naja marina, along with the higher plants and algae which accompany them. Nymphoides peltate was encountered on the muddy bottom. In May and June, 123 species of algae and 25 higher plants were found. The assumption arises that the vegetation of the estuary may change in connection with the construction of the Kakhovsk hydroelectric station. (RZhBiol, No 10, 1955)

Orig Pub : Tr. In-tu zool. AN USSR, 1957, 14, 25-27

Abstract : Diffusion and seasonal dynamics of metastrongylosis in Ukrainian conditions were investigated. The characteristic decrease in the live-stock's infected condition takes place from January to May. There follows its increase until October. Then a second decrease is observed, which is followed in turn by an increase continuing to the end of the year. The summer increase in the infected condition of the pig live-stock can be explained by the spring infection of the animals after

TITLE: A Conference on the Acclimatization of Amur Fishes (Soveshchaniye po akklimatizatsii amurskikh ryb)

PERIODICAL: Priroda, 1958, Nr 8, pp 115-116 (USSR)

ABSTRACT: The first conference on the acclimatization of Amur fishes in water bodies of the European part of the USSR was held in Kiyev at the beginning of February 1958. Representatives of the scientific establishments of Moscow, Leningrad, Kiyev, Riga, Kishinev, Ashkhabad, Khar'kov, Khabarovsk and other cities participated in the conference. At 3 sessions, 10 papers were delivered that dealt with problems of acclimatization, cultivation, biological particularities, parasito-fauna and parasites of such fishes of the Amur as the white amur (a carp species), Hesperiidae, the white bream, Dragocephalum. Special attention was devoted to the white amur and Dragocephalum. Pond cultivation of these two species increases their growth and conserves their valuable qualities. It was found out that these two species feeding on water plants can be successfully cultivated together with carps in ponds. Dragocephalum that becomes sexually mature within 3 years has

Title : A Typological Estimate of Poorly Yielding Soils For
Forest Cultivation Purposes.

Orig Pub: Tr. In-ta lesokhoz. problem AN LatvSSR, 1955, 9, 29-39

Abstract: The soil conditions of pine-growing locations of Nizhnednepr sands are described. The chief areas here are those of well-drained, poorly-developed, sandy soils with ground waters deeper than 2.5 m. The character of their morphological peculiarities is stated. The adaptation of these soils for a thick pine plantation (15-20 thousand units per hectare) was not satisfactory, in the author's opinion, for the reason that the local soil-hydrological conditions were not properly taken into account. A turf-nidus method of pine cultivation is suggested.

TITLE:

PERIODICAL:

ABSTRACT:

In soil science, in the physiology of plants, and in forestry
two methods of registering the transpiration of wood plants
have come into use:
1) an indirect one - the ground balance method (Vysotskiy) and
2) a direct, physiological one (Ivanov).
Although they are sufficiently exact and the difference of their
results does not exceed $\pm 5\%$, they are technically complicated
and require too intense manipulation. The recently elaborated
gradient measuring of the diffusion transformation of water
vapor and the determination of the coefficient of the turbulent
diffusion were not satisfactory. The last mentioned author sug-
gested taking the evaporation capacity in form of an exponent
which integrates the factors causing the evaporation as basis
of the gradient method instead of the specific humidity and of
the coefficient of the turbulent diffusion. The elementary case

Card 1/3

The Registration of Water Expenditure by Forests PA - 3375
with the Help of the Evaporation Gradient.

is based on the hypothesis that the evaporation process of the active surface of the investigated object is proportional to the difference of the evaporation capacity in two different heights between which the diffusion exchange takes place. A paper filter of 25 cm^2 was chosen as evaporation surface. The authors investigated one year old red pine seedlings and one year old stand of Canadian poplars, moreover 4 year old stands of pine and red oak groups. The evaporators were located to in the leafiest parts of the trees and 1,5 m above them. Cut off branches served as control according to Ivanov. From schedule 2 it is evident that the results of both methods are close to each other. In further investigations an additional pair of the gradient apparatuses of A.A.Solopko was used at two points: 1) open on the ground surface, 2) at the same height, covered by tar paper. In the summer of 1956 single standing pines, birchtrees and oaks, 10 - 15 years old, were investigated. Transpiration was computed by means of the formula:

$$T = \pi R L U - \pi R^2 U_o = \pi R (L U - R U_o),$$

where R - is the radius of the lower top cross-section and L - the cone constituent. Schedule 3 proves the applicability of this method. In a dense stand there is no necessity of measuring the tops of the trees. Transpiration conditions in a forest are

Card 2/3

The Registration of Water Expenditure by Forests PA - 3375
with the Help of the Evaporation Gradient.

different to those of a single tree: in open land the gradient of the evaporation capacity increases from 1 - 2m following a straight line. In the vertical profile of the forest there are two minima of the evaporation capacity: in the air layer near to the ground and inside the top cover. As known, the daily curve of plant transpiration is comparable with the saturation deficiency. In the case under investigation the proportionality between the gradient of the evaporation capacity and the transpiration of the stand is confirmed.

ABSTRACT: The author describes a centralized power-supply system which can be used for the engine starting of up to 20 aircraft parked alongside each other on a 300-meter long deployment ramp (Fig. 1). The system, which makes possible a substantial economizing of short-supply cable as well as a considerable reduction in waiting time for automatic mobile starting equipment, operates on a three-conductor system, in which the two main motor generators, driven by the 380/220-volt utility mains, feed three power busses: a common minus (also used as the ground return), plus 24 volts and plus 48 volts. Modified power outlet terminals, type KPA-4, are used for the direct feed of the aircraft power systems. Because of the surge character of the current consumption during the starting sequence, the system calls Card 1/3

TOPIC TAGS: traveling wave, traveling wave tube

ABSTRACT: Formulas are introduced for an approximate calculation of an absorber's attenuation (designed to maintain the stability of a traveling wave tube) according to the amplification required and the experimentally obtained maximum reflection factor. The absorber's effect on the magnitude of current and on the length of the self-excitation wave of the traveling wave tube is analyzed. An attenuation increase of 8 decibels makes it possible to increase the self-excitation current in the traveling-wave tube by four times. There is a bibliography with 2 titles. TITLE: An autonomous optical method of determining orientation of an Earth's satellite in space

SOURCE: Akademiya nauk SSSR. Iskusstvennye sputniki Zemli. no. 14, 1962,
145 - 153

TEXT: The purpose of this investigation is determination of orientation of an Earth's artificial satellite in space from the readings of solar radiation pickups mounted on the satellite. In the first part of the article the problem of determining the vector, denoting direction from the satellite to the Sun, is solved in terms of three direction cosines. The second part deals with the problem of determining the matrix of transformation from the coordinate system "Earth" to the system of "Sputnik". As a result, the matrix was obtained each of whose elements contained the unknown angle of turn of one system relative to the other. This angle can be determined from the reading of at least one scanning pickup whose optical system fixes the line of horizon; provided that the altitude of the
