TITLE: Use of Aeromagnetic Survey Data in Clarifying the
Geological Structure at the Northern Part of the
Turgay Flexure (Primeneniye dannykh aeromagnitnoy
s"yemki dlya vyyasneniya geologicheskogo stroyeniya
severnoy chasti Turgayskogo progiba)

PERIODICAL: Inform. sb. Vses. n.-i. geol. in-t, 1956, Nr 4,
pp 118-123

ABSTRACT: The depth of stratification and composition of the
rock of the substructure of the northern part of the
Turgay flexure are determined from data of an aero-
magnetic survey ΔT conducted in 1952 and 1953 by
the United Siberian Geophysical Trust. The magnetism
of rock I in the southern half of the area was .

Card 1/3

15-57-7-9922

Use of Aeromagnetic Survey Data (Cont.)

calculated chiefly from work sheets of V. A. Bugaylo, and in some cases, according to the formula:

$$I = Z_{\max} / 4 \operatorname{arctg} \frac{b}{h}$$

where b is half the thickness of the stratum and h is the depth of the upper edge. In addition, the following formulas were used for the northern part of the area:

$$I = Z_{\max} / 4 \operatorname{arctg} \frac{b}{h}$$

and

$$I = \int_{-\infty}^{+\infty} Z dx / 2 \pi^2 b.$$

From the magnetic survey data a structural contour map of the substructure surface was plotted with a contour interval of 200 m.
Card 2/3

15-57-7-9922

Use of Aeromagnetic Survey Data (Cont.)

The general relief of the substructure is basically confirmed by drilling data. The conclusion is drawn that calculations of depths, based on the anomaly of the magnetic field, may be widely used for determining the regional relief of the substructure. The author compares the magnetic and gravity maps and concludes that areas of uniform magnetic field coincide with areas of low gravity, while areas of nonuniform magnetic field coincide with areas of high gravity with the value $\Delta g > 20$ mgal. It is suggested that areas of uniform magnetic field and low gravity are areas of the occurrence of the practically nonmagnetic and relatively less dense rock of the substructure (chiefly sedimentary rock). Areas of nonuniform magnetic field are areas of the occurrence of volcanic rock of basic and ultrabasic composition.

TITLE:

Electric Double Refraction of Polystyrene Solutions
(Elektricheskoye dvoynoye luchepreomleniye rastvorov
polistirola)

PERIODICAL:

Vestnik Leningradskogo universiteta. Seriya fiziki i khimii,
1958, Nr 3, pp 73-77 (USSR)

ABSTRACT:

In the present paper experimental data on the electric double refraction in polystyrene solutions are given. The solutions of 7 polystyrene fractions were investigated. Carbon tetrachloride served as solvent. As the experiments showed the dependence $\Delta = f(E^2)$ remains linear in the domain of the concentrations used. The Kerr constant was computed for all measured polystyrene fractions according to the diagram Δ versus E^2 (Table 1). For reasons of comparison the Kerr constant of styrene (Table 2) was ascertained too. The Kerr constant of the solutions of various polystyrene fractions (molecular weight $4 \cdot 10^5 - 5 \cdot 10^6$) is, evidently, within the errors of observation, of similar magnitude as the Kerr

Card 1/3

Electric Double Refraction of Polystyrene Solutions SOV/54-58-3-8/19

constant of styrene. The behavior of the polystyrene solutions in a constant electric field is analogous to their behavior in a magnetic field (Refs 2, 3). As a comparison the molecular Kerr constant of benzene was examined. Measuring results of this constant in carbon tetrachloride at various concentrations are given in table 2. The quantities K_2 for styrene and benzene were determined from the diagram plotting K_{12} versus C_2 . The coefficient of the angular dependence $K_{12} = f(C_2)$ permits to determine the quantity K_2 for infinite dissolution. The computation showed that the molecular Kerr constant of styrenes is by about two times higher than that of benzene. It was found that the Kerr constant of the polystyrene is independent of the molecular weight. Its sign is positive and in its magnitude it resembles the Kerr constant of styrene. These facts prove the conclusions made by the authors (Refs 2, 3, 7). The authors express their gratitude to V. N. Tsvetkov for his interest. There are 2 figures, 2 tables, and 7 references, 4 of which are Soviet.

TITLE: Report on the Ninth All-Union Conference on Cathode
Electronics

PERIODICAL: Radiotekhnika i elektronika, 1960, Vol 5, Nr 5,
pp 866-879 (USSR)

ABSTRACT: This conference took place in Moscow from 21-28th
October 1959 with the participation of Soviet scientists
and guests from Hungary, Eastern Germany, the Chinese
Peoples' Republic and Czechoslovakia. The chairman of
the organization committee was Academician Vekhineskiy.
The report consists of brief abstracts of 125 papers
presented at the plenary sessions and the sections of
the conference. 15 Reports were presented in the section
on surface properties of solids dealing with electron
adsorption and structural properties of active surface
films. Electron-optical studies of "patch fields" on
emitting surfaces were discussed. 6 Papers on the

Card 1/2

physics of semiconductor cathodes were given in the
section on thermionic emission. 17 Papers were
presented in the section on photoelectric emission.
Many papers discussed industrial technology of photocells
and multipliers. 16 Papers were presented at the section
on secondary-electron emission. The section on field
emission heard 11 papers discussing pulse field
emission at high current densities, surface phenomena,
field emission of semiconductors and the "condenser"
cathodes. More than 50 papers and brief communications
were presented at the section on properties, new types
and technology of cathodes, relating to the technology
of various types of cathodes, their behaviour in
practical devices and the operating mechanisms of
individual cathodes. 19 Papers were given at the
section on interaction of solid bodies with streams of
charged particles and residual gases. Notes of
conference discussion indicated that several sharp and
critical exchanges of views took place.

TITLE: Research on the dynamics of pneumatic control devices for different rates of motion

14

SOURCE: AN SSSR. Institut mashinovedeniya. Teoriya mashin i mekhanizmov, no. 100, 1964, 36-47

TOPIC TAGS: automation, automatic control system, pneumatic control system, control system dynamics, biased control device, lift operation

ABSTRACT: Continuing earlier work with a view toward the improvement of control apparatus for automatic machines, the authors tested singly and doubly biased control apparatus both with and without springs. Assuming the pressure of the whole system to be equal to the pressure in the main line, the dimensionless pressure (ratio of pressures) becomes 1 and the equations describing the machine action can be combined and integrated, with the factor representing the characteristic coordinate of position of the machine equal to 1, to give

$$\tau_1 = N \sqrt{\frac{2}{1 - \eta_0}}.$$

Cord 1/4

L 32081-65

D

ACCESSION NR: AT4049379

where T_s = time for the period of operation, Λ_a = characteristic load with respect to the atmosphere (a constant for each case); N = dimensionless parameter of construction. The resultant lines, for varying varying values of Λ_a , are given in Fig. 1 of the Enclosure; dotted lines represent the function obtained under these assumptions, and curved lines represent actual conditions for an ascending lift. The divergence of the actual curves for varying force on a descending lift from those calculated with the simplifying assumptions is greater, but is minimized when $0 < N \leq 0.8$, since the dimensionless pressure becomes nearly constant. Addition of a spring adds the factor of spring resilience to the descriptive equations. Comparative graphs were plotted with and without simplifying assumptions for varying spring rigidity and load, for both forward and backward control. In the former case correspondence was close, but in the latter case, increasing rigidity both depressed the curves and caused an increase of constant divergence. The dynamics of doubly-biased control apparatus must be described with three equations, adding factors for the effective area of the piston and for the exhaust system. Decreasing the load for decreasing values of the load and exhaust system factor greatly increases the divergence between actual curves and curves calculated with simplifications. For all cases considered, the operating velocity was determined as a function of Λ and η_4 for singly biased apparatus and of the exhaust system for

Card 2/4

L 32083.65

ACCESSION NR: AT4049379

doubly biased apparatus. In the former case, N=5 produced smooth, uniformly increasing curves which increased with η . In the latter case, curves decreased with increasing η . Orig. art. has: 19 formulas and 10 figures.

TITLE: Photoelectric and optical properties of tellurium-rubidium photocathodes

SOURCE: Radiotekhnika i elektronika, v. 11, no. 6, 1966, 1100-1106

TOPIC TAGS: photocathode, UV receiver, TELLURIUM, RUBIDIUM, OPTIC PROPERTY, PHOTOELECTRIC PROPERTY

ABSTRACT: The results are reported of an experimental study of (a) the effect of the degree of activation of Te by Rb on the spectral characteristics of Te-Rb photocathode and (b) the effect of the thickness of Te layer on the photocathode sensitivity at $\lambda = 2600 \text{ \AA}$ with frontal and rear illumination. The results of the study can be used in designing sun-blind 2000-3000 \AA receivers. The best spectral characteristics were obtained when Te was activated by Rb vapor and the

Card 1/2

L 07096-67

ACC NR: AP6019000

photocurrent was monitored; the photocathode was illuminated by a bactericide lamp whose maximum radiation lay at $\lambda = 2537 \text{ \AA}$; optimal activation resulted when the process was stopped after a maximum photocurrent had been attained. An excess of Rb resulted in a higher sensitivity in the over-3000 \AA band. With frontal illumination, the Te-Rb photocathode sensitivity to 2600- \AA radiation increased with the thickness of the Te layer up to 200 \AA , and beyond that thickness, varied but little. With the rear illumination, the maximum sensitivity corresponded to a Te layer thickness of about 60 \AA . Plots of optical transmissivity and quantum yield of the Te-Rb photocathode vs. photon energy are shown. Orig. art. has: 4 figures and 3 formulas.

TITLE: On an algorithm for the simplification of Boolean functions with the aid of a general-purpose computer

SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kibernetika, no. 2, 1966, 59-64

TOPIC TAGS: ~~general-purpose computer~~, Boolean function, algorithm, approximate solution / Minsk-1 ~~general-purpose computer~~ABSTRACT: An approximate method of simplifying the Boolean functions of a large number of variables specified by the constituents of the unity and zero is presented. The method is based on conversion of the Boolean function F of n variables to the relative function F^t which makes it possible to reduce the volume of scanning. This method is most effective in the case of weakly defined Boolean functions. E.g. when solving the problem with the aid of the Minsk-1 general-purpose computer and using the direct-access memory alone, the number of variables may be 30, while the number of obligatory and prohibited constituents (elementary conjunct-

TITLE: Use of electronic computers for the synthesis of pneumatic relay control systems

SOURCE: AN SSSR. Institut avtomatiki i telemekhaniki. Pnevmoavtomatika (Pneumatic automation). Moscow, Izd-vo Nauka, 1966, 28-35

TOPIC TAGS: pneumatic control system, boolean function, binary logic, mathematic logic, computer program logic

ABSTRACT: The authors propose a simplified method for expressing relay logic operations in terms of boolean logic and for reducing the amount of effort necessary to decrease the required number of elements for a given function to a minimum. The method uses weighted numerical equivalents representing all given components of the system. The weights refer to one main component which has a numerical equivalent of zero. In the geometrical interpretation of the boolean function, this means that the origin of the component is located. In view of the great difficulty of locating an absolute minimum form of a boolean function with many variables, the process reduces to finding several minimum forms and selecting the best one. The initial information is given in

Card 1/2

L 09270-67

ACC NR: AT6021724

the form of a set of independent and disjunctive necessary and forbidden components, corresponding to the necessary and forbidden system states. These numerical equivalents are expressed in binary system; however, for the sake of simplicity, the binary numbers are written in octal system. A table for converting binary numbers into their octal equivalents is included. A series of iterative operations using Boolean logic is performed to optimize the selected set of octal numerical equivalents. Original has: 3 tables.

TITLE: Some properties of unalloyed polycrystalline molybdenum

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 12, 1966, 49-50

TOPIC TAGS: molybdenum, polycrystal, arc furnace, tensile strength, plasticity, annealing, embrittlement

ABSTRACT: The material was remelted without deoxidation in a JEVM-03 electron-beam furnace, and cast into ingots 25 mm in diameter and up to 300 mm high. The following melting conditions were used: the feed rate of the rod was 10-20 mm/min, the melting rate was $23.7-47.4$ g/min, and the pressure was $2 \cdot 10^{-4}-7 \cdot 10^{-5}$ mm Hg. Impurity contents are given for the original and remelted molybdenum. After remelting the O₂ content decreased from $6 \cdot 10^{-3}$ wt % to $4 \cdot 10^{-4}$ wt %. The ingots were hot worked into rods and billets, cold worked, and recrystallized by annealing in a vacuum for 10 hr at 1000°C. Results are given on the hardness, microhardness, electrical resistivity, elastic modulus, and other elastic properties determined by the resonance method. The ultimate tensile strength and ductility are given as functions of annealing temperature. Annealing was done at a residual pressure which did not exceed $1 \cdot 10^{-4}$ mm Hg.

TITLE: Effect of ultrasonic vibration on the structure of electron-beam melted molybdenum

SOURCE: Tsvetnyye metally, no. 7, 1966, 83-85

TOPIC TAGS: molybdenum, molybdenum melting, electron beam melting, ultrasound application, ultrasound effect, molybdenum property;

ABSTRACT: The effect of subsonic and ultrasonic vibrations on the crystallization of molybdenum, electron-beam melted in a $5 \cdot 10^{-4}$ mm Hg vacuum, has been investigated. Subsonic vibrations at a frequency of 1000 cycle/min reduced the grain size from 3-5 mm to 2-3 mm. Ultrasonic vibrations with a frequency of 2-18 kilocycle substantially reduced the grain size in the transverse direction but had very little effect on the grain size in the longitudinal direction, leaving the columnar structure unchanged. The Brinell hardness of molybdenum melted with ultrasound amounted to 153-156 kg/mm², i.e., was of the same order as that of molybdenum melted without ultrasound. Preforged

TITLE: Some data on the ternary titanium-boron-chromium system

PERIODICAL: Poroshkovaya metallurgiya, no. 6, 1962, 42 - 49

TEXT: The object of the present investigation was to study the constituents of the Cr-B and Ti-B-Cr systems. In the first stage of the investigation, thermal and metallographic analysis as well as hardness and microhardness measurements, conducted on Cr-B alloys with up to 40 at.% B, cooled slowly to room temperature or quenched from 1450°C, were used to construct the Cr end of the constitution diagram of the Cr-B system. In the second stage, the same experimental technique and, in some cases, X-ray diffraction analysis, were used to study the Ti-B-Cr system. The experimental alloys included the following: some binary Ti-B, B-Cr and Ti-Cr alloys; alloys of the pseudo-binary $TiB-CrB$, TiB_2-CrB_2 , $TiCr_2-CrB$, $Ti-CrB_2$, $Ti-Cr_5B_3$ and $Cr-TiB_2$ systems;

Some data on

alloys defined by sections parallel to the Cr-B side of the ternary system at 3, 10, 15, 25, 35 and 45% Ti. The results obtained were insufficient to construct a complete constitution diagram of the system studied. It was established, however, that the single-phase fields constituted only a small proportion of the isothermal section of the system at room temperature. These fields correspond to solid solutions based on Ti, Cr and B and on some binary and, possibly, ternary intermetallic compounds. In addition, TiB_2 and CrB_2 form a continuous series of solid solutions. There are 7 figures.

(Moscow)TITLE: Several Properties of the WSi₂ - NbSi₂ System Alloys

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Metallurgiya i toplivo, 1959, Nr 6, pp 102-109 (USSR)

ABSTRACT: Alloys were prepared from powders containing 99.2% Nb, 99.7% W and 99.13% Si. Mixtures containing 23-37% Si, 1.2-76% W and 0.4-62% Nb were prepared by hot pressing, followed by arc melting. The final compositions are given in Table 1. Microsections were prepared in the cast state and after 360 hours at 1000 °C followed by a slow cool. Alloys containing less than 59.2% NbSi₂ single phased. The primary crystals of alloys on the WSi₂ side had a long columnar-type structure, with thin films of the second phase in the grain boundary. In the alloys lying on the NbSi₂ side, the primary crystals were more rounded. The alloys containing 29.3% NbSi₂ had approximately equal amounts of both phases. The heat treatment coarsened the structure of the alloys and decreased the quantity of second phase in alloys

System Alloys

Several Properties of the WSi₂ - NbSi₂ System Alloys

containing up to 1.9% NbSi₂. The microhardness of the WSi phase was 1255-1280 kg/mm². The microhardness of 100% NbSi₂ was 1038 and fell to 780 kg/mm² with a decrease to 71% NbSi₂ in the alloy. Further decreases in NbSi₂ content led to an increase in microhardness. The Vickers hardness increased from 723 to 840 kg/mm² with increase in NbSi₂ content from 0.7 to 65%. Further increases in NbSi₂ content gave a curve similar to that for microhardness. X-ray investigations showed only NbSi₂ content. The lattice parameter decreased with increase of WSi₂ from 1.6 to 28.7%. The porosity of the alloys varied from 1 to 7%. The electrical resistance was found and calculated for zero porosity. The resistance increases from 17.4 to 148.9 micro ohm/cm with increase in NbSi₂ content from 0 to 48.5%. It then fell to 23.2 micro ohm/cm in the 98.4% NbSi₂ alloy. The high temperature strength at 1100 and 1200 °C in air gave poor results. The oxide layer formed on the alloys is porous and does not protect them from further oxidation. An equilibrium diagram was drawn from the above results ✓

at 970°C. ΔH_{298}° is about 24 kcal/mol for YB_6 ;
analysis gives 42.11% B (theory 42.19%). Yield at
1800-1900°C 92-93% (YB_6 partially dissociates at this
temperature). The powder pattern gives the lattice
constant as 4.128 Å. Table 1 gives the Ψ , hkl and
intensity values. The pyknometer density is $3.64 \pm$
 0.04 g/cm^3 (X-ray density 3.633). Hot-pressed
specimens have a microhardness of $3264 \pm 21 \text{ kg/mm}^2$.
Card 1/2 (50 g load); YB_6 reacts with graphite at 2100-2150°C.

SOV/126-6-2-11/34

Preparation and Certain Properties of Yttrium Hexaboride

and fuses at about 2300°C . The thermionic emission (Richardson) curve is compared with those for LaB_6 and CeB_6 ; the relevant constants are work functions $2.22 + 0.05 \text{ eV}$ and $A = 15 \text{ amps/cm}^2 \text{ deg}^2$. The thermal emission coefficient at 1500°C is 0.7 (for $655 \mu\text{m}$). The results are discussed in relation to the electronic structure of the compound.

There are 2 figures, 3 tables and 11 references, 5 of which are Soviet, 5 English, 1 German.

Preparation of high-grade anthracene and carbazole from crude anthracene. M. I. Polyakova. *Coke and Chem. (U. S. S. R.)* 1938, No. 2-3, 75-81.—Crude anthracene is heated for 4 hrs. at 140-50° with a 115% excess of maleic anhydride (I), the product heated with 10% Na₂CO₃ or NaOH, and the soln. filtered. The washed residue is shaken with an equal vol. of C₆H₆ (1 hr. at 20°) and filtered. The residue consists of 70-77% carbazole; the filtrate yields, when evapd., 45% phenanthrene. Excess of H₂SO₄ is added to the alk. filtrate at room temp., and the C₆H₆-I adduct collected, washed, dried and heated at 300° to yield a sublimate of anthracene and I. The washed sublimate is heated with 10% NaOH to remove undissolved adduct, and the residue washed, dried and recrystd. from C₆H₆ to yield 95-7% anthracene. B. C. P. A.

benzene and methanol vapor adsorption on carbon black. (1)
M. M. Polyakova and P. A. Tesner. *Doklady Akad. Nauk S.S.R.* v3, 655-8(1953).—Different tech. grades of C blacks were used in the adsorption tests, and the specific surface of the various samples, as calc'd. from the adsorption values, were different for the different grades. The abs. benzene adsorption isotherms calc'd. from these values, however, agree excellently. The adsorption isotherms for MeOH on nonporous C blacks were very similar to the isotherms on graphite obtained by Pierce and Smith (*C.A.* 44, 4708d), but the MeOH adsorption isotherms on porous blacks are S-shaped curves, very similar to the CH₄ isotherms. The coating of the surface pores with thermally deposited C (by decompr. of hydrocarbons) even when only 1/4 mol. thick, produced the same type of isotherms as with graphite. The difference in behavior is explained by the nonuniformity of the porous C-black surfaces or sections of the surfaces.
W. M. Sternberg

POLYAKOVA M.M.

✓ Structure studies of carbon-black-particle surfaces. M.
S.S.R. 93, 1061-4(1953).—The evening-out of the struc-
ture of porous C-black surfaces was studied on 23 samples of
channel C, heated at 900° with hydrocarbons (CH_4 and
 C_2H_6), as described by T. and Rudal'kes (cf., C.A. 47, 3671r).
The results show that the specific surface is at first reduced,
until covered with a mol. layer of C. Similar tests with
other grades of C black (C_2H_2 and others) indicate no appre-
ciable surface reduction. The difference in results obtained
with different grades of C black has led to the development
of a method of measurement of the "porosity coeff."
defined as the ratio of specific surfaces of C black before
and after coating them with C layers. W.M. Sternberg

Title : Variations in the Location of the Arch of Aorta and of
Its Major Branches in Man

Orig Pub : Khirugiya, 1957, № 5, 149-151

Abstract : In 100 cadavers of adult humans, seven variants of the
branching out of the innominate trunk (divided into the
right subclavicular and common carotid arteries) and of
the left subclavicular artery from the arch of aorta
were found. In 89 cases, the upper semicircle of the arch
of aorta was located 0.2-4 cm beneath the edge of the ju-
gular notch, and in four cases 0.2-1 cm above the notch.
In 70 cases, the upper semicircle of the left innominate
vein was found 0.1-3 cm beneath the jugular notch,

in 10 cases 0.2-1 cm above the notch, and in 20 cases at the same level with the jugular notch. In seven cases, not three but only two arteries originated in the arch of aorta, while in eight cases a. thyrocidea ima was found to originate in the innominate artery.

Abstract : The thoracic duct was injected with a solution of
iron sulphate, and the azygous vein was injected
in retrograde fashion with a solution of "red
blood salt". The formation of Turnbull blue
occurred in the lymphatic-venous anastomoses (LVA).
The latter, measuring 2-3 cm in length and 0.1-
0.2 cm in diameter, were found most frequently

AUTHORS: Kiselev, A. V., Kovaleva, N. V., Polyakova, M. N., Tesner,
P. A.

TITLE: Adsorption properties of oxidized carbon blacks. 2. Oxida-
tion of channel black in a gas medium

PERIODICAL: Kolloidnyy zhurnal, v. 24, no. 2, 1962, 195-200

TEXT: The authors study the reason why oxidized channel black gives better printing ink than unoxidized channel black. Ukhta gas channel black sample B-1369 (V-1369) was oxidized for 2 hrs with atmospheric oxygen at 450°C and an air stream of 3 liter/min. The weight loss was 4-5%; the O₂ content increased from 4.4 to 8.15%; the specific surface (determined by the BET method) increased from 148 m²/g to 295 m²/g for N₂ and C₆H₆, and 142 m²/g for n-C₆H₁₂. The black samples were evacuated to 10⁻⁵ mm Hg at 200°C; next the adsorption isotherm for vapors of n-hexane, benzene, methanol, and water were taken. Results: (1) The total adsorption capacity for all vapor kinds doubled; (2) the adsorption capacity per surface unit, however,

Card 1/2 ✓

Adsorption properties of ...

S/069/62/024/002/005/008
B101/B110

increased only for n-hexane and benzene, that for methanol changed but little, whereas that for water remained unchanged. Thus, the hydrophily of black oxidized with atmospheric oxygen, remained unchanged. The high adsorption of hydrocarbons is due to the adsorption potential of micro-pores formed during oxidation. The lower adsorption capacity for C₆H₁₂ is explained by its larger molecules which cannot infiltrate into all pores.

(3) Channel black oxidized in a liquid medium (HNO₃ + H₂SO₄) showed increased hydrophily and adsorption of polar substances, owing to a considerable increase in surface groups containing oxygen. There are 2 figures, 1 table, and 13 references: 9 Soviet and 4 non-Soviet. The four most recent references to English-language publications read as follows: W. R. Smith, W. D. TITLE: Use of electronic computers for the design of pneumatic devices

SOURCE: Akademiya nauk SSSR, Institut mashinovedeniya. Seminar po teorii mashin i mekhanizmov, Trudy, v. 22, no. 85/86. Moscow, 1961, 68-86.

TEXT: The authors deal only with the interval of displacement of the piston and two-sided pneumatic device with constant load. The equations of motions of the device are quoted from previous papers and the results of solution by an electronic simulating device and by a digital "Strela" computer are considered. Oscillograms and graphs of the solutions in dimensionless quantities are given for several values of parameters and analyzed in detail. It is stated that the solutions by simulating devices were checked on a digital computer and found to be accurate up to 5-7%. The graphs and oscillograms allow the time of piston displacement to be determined for a wide range of constructions of pneumatic devices. There are 11 figures, 1 table and 9 Soviet-bloc references.
