Edited by M. B. Altman, A. A. Lebedev, A. P. Polyanskiy, and M. V. Chukhrov, Moscow, Metallurgizdat, 1956, 491 pp. (from catalogue card, State Library USSR Invent. V. I. Lenin, 6P/1)

... and casting aluminum and magnesium alloys. Information on casting in sand molds, chill molds, pressure casting, shell casting, and investment casting is presented. Furnace layouts for smelting are studied. Instructions for the collection and reprocessing of tailings and methods for inspecting castings and the mechanical properties of alloys are specified. A separate chapter is devoted to the properties of aluminum and magnesium alloys. Bibliography (21 items). The book is intended for engineering-technical workers of enterprises in which light metal castings are produced, and may also be used as a textbook for students in higher educational institutions."

Subject : USSR/Mining AID P - 336
Card : 1/1
Author : Polyanskiy, A. P.
Title : Construction defects of a tightening arrangement packer
Periodical : Neft. Khoz., v. 32, #5, 48, My 1954
Abstract : The author remarks on the comments of B. S. Tolmachev published in the Neft. Khoz., No. 4, 1953 concerning the article by M. A. Zelinskiy and A. N. Shermatov "For a Rational Construction of Equipment for the Bottom and Mouth of Gas Wells", published in the Neft. Khoz., No. 7, 1952. The author considers that the packer, shown on fig. 5, of the reviewed article, has many defects and is unsatisfactory in service.

TITLE: Rigidity variation and damping capacity of a gas turbine engine housing with horizontal flanged connection

60
54
B

SOURCE: Ref. zh. Turbostroyeniye, Abs. 1.49.114

REF SOURCE: Tr. Kuybyshevsk. aviats. in-t, vyp. 19, 1965, 183-193

TOPIC TAGS: turbine engine, vibration damping, bending stress, material deformation

ABSTRACT: The rigidity of the gas turbine housing has a strong effect on critical rotor conditions. The authors study the change in rigidity and damping capacity when the housing is deformed in models of gas turbine engine housings with horizontal flanged connection. It is shown that bending deformation in housings of this type may cause slippage which reduces the bending rigidity of the housing and increases power dissipation. This type of housing has a two-phase static deformation cycle which is satisfactorily represented by the static cycle of a composite rod properly designed to act as an equivalent rod for the housing. The reduction in housing rigidity due to slippage is 10-30% of the initial value which gives a dissipation factor $\psi=0.2-0.6$. The relative rigidity of the housing and the dissipation factor basically conform satisfactorily to the theoretical relationships. The

amplitudes of forced vibrations may be calculated quite accurately from the parameters of the static cycle for the housing as well as from the optimum tightening forces corresponding to maximum deformation. [Translation of abstract]

Accumulation of methane in the coal bunkers of coal
beneficiation plants. R. M. Petrukhin and I. P. Polyanski.
Ugol 29, No. 4, 9-10(1954).—A no. of cases of methane ig-
nition in coal bunkers has been observed. Methane was
actively evolved from coal during the first 5-6 hrs. upon
storage, and the evolution was more intensive from moist
coal than from dry coal. As a fire safety measure, the
bunkers in the beneficiation plants should be covered with
slag cover. Because of the possibility of accumulation of
dangerous amounts of methane in the corrugations of fire
covers. W. M. Striberg.
