Trudy, vyp. 14 (24) (Transactions of the Scientific Research Institute of Terrestrial Magnetism, Ionosphere, and Propagation of Radio Waves, No. 14 (24)) Moscow, Svyaz'izdat, 1959. 144 p. Errata slip inserted. 1,000 copies printed.

Additional Sponsoring Agency: Ministerstvo svyazi SSSR

Ed.: (Title page): N. Ye. Malinina; Tech. Ed.: K.G. Markoch; Ed. (Inside book): G.I. Kiseleva.

PURPOSE: This publication is intended for geophysicists and other scientific and technical personnel in research institutes and geological exploration organizations. It may also be used by students of geophysics and geology.

COVERAGE: The articles in this collection deal with problems concerning the permanent magnetic field. The magnetic field of the earth and the geophysical phenomena associated with it, the geologic structure of the earth's crust, the

Card 1/4

Transactions of the Scientific Research Institute (Cont.)

SOV/4314

magnetic properties of rocks, and the influence of the topographic relief upon magnetic measurements are discussed. The first of the three articles in the collection has been abstracted separately. References follow each article.

TABLE OF CONTENTS:

Pochtarev, V.I. Relationship of the Magnetic Field of the Earth With Other Geophysical Phenomena and With the Geologic Structure of the Earth's Crust

The author shows that the magnetic field of the earth is closely related to geologic features of the structure of the earth's crust and to the petrographic heterogeneities of the rocks composing it. It is shown that global anomalies are located on platform blocks which constitute the most stable sections of the earth's crust. The global centers of secular changes in the magnetic field correspond to geosynclinal regions, as unstable sections of the earth's crust. This distribution of global magnetic anomalies and of secular trend centers results from the fact that the rocks composing the crust, as well as part of the subcrustal layer involved in tectonic processes, possess magnetic properties and, undergoing a change with time, form the centers of the secular trend. This is also proved by the simultaneous existence of gravity and magnetic anomalies, a fact which can not be explained by the electric nature of magnetic anomalies. Electric currents

Card 2/4

Transactions of the Scientific Research Institute (Cont.)

SOV/4314

may generate the necessary magnetic field, but they can not account for the presence of the gravity anomaly field caused by large masses of considerable density. The geothermal gradient, usually accepted as equal to 33° per 1 km, can not be used in calculations of the temperature of the Earth's interior, since this gradient has been deduced on the basis of data referring only to sedimentary rocks. On the other hand, secular changes of the magnetic field may be regarded as a source of valuable information on the thermal and chemical processes occurring inside the Earth's crust. The author is of the opinion that his thesis on the origin of the global magnetic anomalies, as outlined in the article, makes it possible to explain those characteristic features of the magnetic field which hitherto have remained unexplained, namely: the geographic location of global magnetic anomalies and their relation to gravity anomalies; the complex phenomena of secular changes, ~~global, regional,~~ and local; the observed position of the magnetic poles; the greater magnetization of the Eastern Hemisphere, as compared with the Western; the behavior of zero isogonal lines, etc. The author thanks B.M. Yanovskiy, B.A. Andreyev, Yu. D. Kalinin, V.P. Orlov, D.L. Finger, and P.M. Gorshkov.

TITLE: Range of application for diamond wheels made with an organic binder

SOURCE: Stanki i instrument, no. 3, 1967, 7-11

TOPIC TAGS: diamond, grinding, abrasive material, synthetic material, CUTTING TOOL

ABSTRACT: Data are given on the use of diamond wheels made with bakelite binders with respect to selection of the most efficient conditions for grinding various types of hard-alloy cutting tools. The experimental work was done on S194 and 3A64AM grinders using AChK125x10x3 wheels using M1 and B1 binders with grain sizes of A8 and A5 respectively. Analysis of experimental data on the effect which grain size has on cutting conditions and wheel wear shows that diamond wheels with moderate granularity (AS6-AS12) have the highest cutting capacity. Coarser wheels (AS16-AS25) have poorer cutting properties while fine-grained wheels show the worst cutting performance. It was found that an increase in diamond concentration reduces cutting force requirements. Diamond wheels with a bakelite binder show minimum wear with a 100-150% diamond concentration for grain sizes of AS12-AS8. Test data show that Soviet diamond wheels based on organic binders are as durable and productive as the best models made by some firms in the United States, Belgium, Holland and Japan. POPKOV, S. L.

On 28 December 1945, at the Power Engineering Institute imeni Kolotov, defended his dissertation on "Single-Phase Induction Transmitters of Synchronous Rotary Motion Using Constant-Frequency Alternating Current". Official opponents - Doctor of Technical Sciences Professor N. V. Gorokhov, and Doctor of Technical Sciences Professor Ye. V. Nitsov.

So: Elektrichestvo, No 4, April 1947, pp 90-94 (U-5577, 18 February 1954)

This work presented the principal circuits which determined the electromagnetic processes in the elements of single-phase transmission of synchronous rotary motion with asymmetry in the primary and secondary circuits. As a result the characteristics were determined of single-phase transmission of synchronous rotary motion, relationships were obtained in simple form for the currents and the moment of normal single-phase transmission of synchronous rotary motion, taking into account the full resistance of the primary circuit, and a simple method was given for calculating the characteristics of single-phase transmission of rotary motion with small displacement angles using normal asynchronous motors. The precision of the method of calculation presented was verified experimentally.

Continuous and discrete servomechanisms (Nepriery*vny*ye i diskretny*ye sledyashchiye sistemy*). Moscow, Izd-vo "Energiya", 1964. 303 p. illus., biblio. 15,000 copies printed.

TOPIC TAGS: servomechanism, servosystem, continuous servosystem, discrete servosystem, linear servosystem, nonlinear servosystem, pulse servosystem, digital servomechanism

PURPOSE AND COVERAGE: This book is intended for technical and scientific personnel concerned with automation. It deals with some problems of the theories and the calculation of continuous servosystems during regular and random effects and of relay and pulse servosystems. Various types of coding and decoding converters are studied on the basis of digital servosystems and a qualitative evaluation of the latter is given.

TABLE OF CONTENTS:

Foreword -- 3

Card 1/6

AM4016101

Introduction -- 7

1. Types of servosystems -- 7
2. Methods of calculating servosystems -- 18

PART ONE. CONTINUOUS SERVOSYSTEMS

Ch. I. Calculation of servosystems on the basis of selected qualitative indexes -- 25

1. Determination of servosystem parameters on the basis of the minimum of the integral square deviation -- 25
2. The principle of maximum and its application for the solution of simple problems concerning the maximum speed of response -- 35
3. Synthesis of a servosystem having a maximum speed of response based on the maximum principle -- 44

Ch. II. Linear servosystems during random signals -- 52

1. Some information from the theory of random processes -- 52

Card 2/6

AM4016101

2. Passage of a random signal through a linear system. The quality of a system -- 60
3. Determining servosystem parameters on the basis of the minimum of mean square deviation -- 67
4. Determining servosystem structure under the condition of the minimum of mean square deviation -- 78
5. Selection of servosystem correcting device on the basis of the minimum of mean square deviation -- 90

Ch. III. Nonlinear servosystems during random signals -- 107

1. Evaluation of servosystem quality by the method of statistical linearization -- 107
2. Application of Markov processes in evaluating servosystem steady-state errors -- 125
3. Selection of the correcting device in a nonlinear servosystem -- 142

Card 3/6

AM4016101

PART TWO. DISCRETE SERVOSYSTEMS

Ch. IV. Relay servosystems -- 148

1. Stability and quality of a relay servosystem -- 148
2. Analysis of a relay servosystem operating under natural oscillation conditions -- 155
3. Determining natural oscillation parameters in a relay servosystem by the method of harmonic balance -- 166
4. Analysis of a relay servosystem with a harmonic input signal -- 175
5. Optimum transients in a relay servosystem -- 183

Ch. V. Pulse servosystems -- 188

1. Lattice functions and discrete Laplace transforms -- 188
2. Transfer functions of a pulse servosystem -- 205
3. Frequency characteristics of a pulse servosystem -- 213
4. Stability criteria of a pulse servosystem -- 220

Card 4/6

AM4016101

5. Quality of processes in a pulse servosystem -- 231
6. The pulse servosystem with a key -- 240
7. Nonlinear pulse servosystem -- 251

Ch. VI. Digital servosystems -- 265

1. General information -- 265
2. Digital servosystem for program control of an object -- 280
3. Quality of a digital servosystem -- 286

Appendix 1. Table of integrals -- 292

Appendix 2. Dependences $c_1(\langle\theta\rangle, \delta_1)$ and $c_2(\langle\theta\rangle, \delta_1)$ for typical nonlinearities -- 294

Appendix 3. Some information on Markov process theory -- 298

Bibliography -- 302

TITLE: An Example of Calculating a Servo System⁹

PERIODICAL: Tr. Vses. zaochn. energ. in-ta, 1958, No. 9, pp. 170-187

TEXT: An example is given of calculating a servo system consisting of the following components: a synchrotransformer, an electronic amplifier, an EMU (EMY) with transverse field, a control motor, and a reducing gear. The nonlinearities of the electronic amplifier, the motor and the reducer are taken into account. Equivalent amplitude-phase characteristics are plotted for the nonlinear components according to the L. S. Gol'dfarb method. The choice of the feed back parameters is performed, and the phase trajectories of the optimum transient processes are plotted, which are used for determining the characteristics of the functional converters switched into the system for the realization of the optimum conditions. ✓B

The Future Will Be Marked by the Highest Energy Equipment
(Gryadushcheye budet znamenovat'sya vysochayshey
energovoorozhennost'yu)

PERIODICAL:

Tekhnika molodezhi, 1959, Nr 2, p 9 (USSR)

ABSTRACT:

To a question asked by the editors of the periodical
"Tekhnika - molodezhi" how he imagined future, V. Popkov
answered: Communism will be marked by the highest productivity
and consequently by the energy equipment of human working
capacity. The energy equipment will have to exceed the modern
"high" standards 10, 100, 1000 times. For this purpose, not
only the inexhaustible sources of energy - guided thermonuclear
reactions - must be utilized, but the whole transformation of
energy must be controlled. It should be achieved that any
energy is immediately transformed to electric energy. And vice
versa, one should be able to convert electric energy directly
to other energies. I do not believe that the technology of the
future, the Communist technology, will go the way of individual
atomic "pocket batteries". The advantages of a centralized

TITLE: Calculation of the Forces and Deformations in the Body of Tooth Gears With Arms (Raschet usiliy i deformatsiy v korpuse zubchatykh koles so spitsami)

PERIODICAL: Sb. tr. In-ta stroit. mekhan. AN UkrSSR, 1955, Nr 20, pp 5-38

ABSTRACT: The stressed state of the body of a tooth gear equipped with arms is determined. The gear is examined as a cyclically symmetrical multicontour frame. The following assumptions are made: 1) The rim of the wheel has a constant cross section and is considered as a beam with small curvature; 2) The axis of the rim, the axes of all arms, and the external loads all lie in a single plane; 3) All arms are alike and are rigidly fixed in the rim and in an absolutely rigid hub. A numerical example is given of the calculation of the body of a gear for the reduction gear of a shaft elevator; the derivation of calculation formulas is given.

TITLE: Initial Stresses in Composite Wheels (Nachal'nyye napryazheniya v sostavnykh kolesakh)

PERIODICAL: Sb. tr. In-ta stroit. mekhan. AN UkrSSR, 1955, Nr 20, pp 73-95

ABSTRACT: An approximate method for the determination of the stresses arising from the assembly of composite wheels equipped with spokes. For wheels having a sectional hub the forces exerted by the fit of the tire onto the center of the wheel and the forces resulting from the fit of the fastening rings onto the hub are determined. The formulas obtained are employed also for the calculation of the initial stresses in wheels with a solid hub. A numerical example is adduced showing the stresses in the body of a composite wheel with a cast-iron center, a steel tire, and six spokes.

In DC circuits the coronization of two parallel conductors of different polarity is connected with a much greater current power than the current in a unipolar discharge. Author conducted experiments to study the electric fields and the distribution of the volume of ion discharges and arrived at the conclusion that the

1671. Ion Recombination Coefficient for Coronal Discharge in Air, by V. I. Popkov. Doklady Akademii Nauk ~~SSSR~~ 59, p. 61-64, January 1, 1948. (In Russian)

Coefficients of volume recombination were obtained by previous workers from measurements taken in an ionisation chamber on ions generated by alpha or x-rays. These figures are applicable only to long lived ions (about 0.1 sec), since for smaller intervals the so called initial recombination prevails in the ionisation chamber, making the determination of the volume recombination rather difficult. In certain discharges in air, as for instance in the coronal discharge, the recombining ions, moving in a field of high gradients, are considerably shorter lived, and it is possible to calculate the recombination coefficient on the basis of an experimental study of the field. In the case of a bipolar corona two streams of ions move in opposite directions between the electrodes. The lifetime of every recombining ion is equal to the time spent in moving the ion from one of the electrodes to the point of the field at which the recombination coefficient is to

be determined. The growing difference in lifetime of the two recombining ions causes the coefficient to increase toward the two electrodes, from a minimum corresponding to a middle point. The obtained values of the recombination coefficient (maximum 2.16×10^{-6} minimum 1.26×10^{-6}) show only small deviation from those given by authors using the ionisation chamber method.

3260. The problem of determining the parameters of the equivalent circuit for a line in corona conditions. N. B. BORDANOVA AND V. I. INDIKOV. *Izv. Akad. Nauk, SSSR, Otdel. Tekh. Nauk*, 21 (No. 3) 381 R (1951) In Russian.

Analysis of published experimental data enables a line under corona to be represented to a first approximation by a variable corona conductivity g and a variable distributed capacitance ΔC inserted between conductor and earth. The corona conductivity g corresponding to the first harmonic of the current and under good weather conditions, in the loss range above 3-4 kW/km per single conductor is a linear function of the voltage U of the conductor against earth, viz. $g \rightarrow A(U - U_{crit})$. This holds up to a ratio $U/U_{crit} = 1.5$. The parameters of the straight line $g = f(U)/A$ and the values of U_{crit} were determined from the available data on corona losses. The increment ΔC of the capacitance of the line under corona is also a linear function of the voltage, viz. $\Delta C \rightarrow B(U - U_{crit})$ and the parameters of this relation, i.e. B and U_{crit} could also be determined from the empirical data.

Title : Problems of the theory of bipolar direct-current corona

Periodical : Zhur. tekhn. fiz., 25, No 13 (November), 1955, 2406-2410

Abstract : Problems of the theory of bipolar corona have been investigated by N. A. Kaptsov (Koronnyy razryad [Corona discharge], State Technical Press, 1947), and by the present writer (Izv. AN SSSR OTN, No 4, 1948; DAN SSSR, 59, No 1, 1948), in whose works one may find a bibliography. These works describe theoretically the characteristics of this kind of corona discharge and give experimental investigation of its physical mechanism. Later L. E. Tsyrlin (ZhTF, 23, 10, 1954; 23, 1, 1954) considered the solution of the problem of the volt-ampere characteristics of bipolar corona. The present writer remarks that Tsyrlin's representations concerning the physical mechanism of coronas and treatment of previous works contain deficiencies, which are discussed.

3346. THE METHOD OF ESTIMATING ANNUAL CORONA LOSSES

V.I. Popkov and N.B. Borshchov. Elektricheskoye, 1957, No. 1, 9-10. In Russian.

Investigations in recent years suggest that the annual energy balance of 400 kV lines is appreciably influenced by the losses during rainy periods. The laboratory investigations of corona were therefore partly carried out in artificial rain of controlled intensity. The discrepancies between laboratory experiments and investigations on experimental lines were partly due to the fact that in the latter case the experimental conditions could not be varied at will, so that the losses were in this respect, as a rule, higher than the latter. Laboratory experiments were carried out on a particular case was taken to elucidate the influence of all the factors, e.g., on insulator string and fitting potential, on the corona loss, and to obtain purely the corona losses for considerable steady-state conditions, including rain from 0.5 to 5 mm/min intensity, the authors. The results were then applied to meteorological data for all the climatic regions of the U.S.S.R. The method of evaluation is partly based on Cohen and Felbly's procedure published in CIGRE reports, with some original improvements by the authors.

19. Space Charge Movement in Alternating Current Corona

"Experimental Investigation of the Space Charge Movement in the Corona Field of an Alternating Current," by V. I. Levitov, A. G. Lyapin, and V. I. Popkov, Power Engineering Institute, Academy of Sciences USSR, Izvestiya, Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk, No 1, Jan 57, pp 14-32

Results of the work are summarized as follows;

"1. It was experimentally proved that the presence in the outer zone of the alternating current corona of a space charge drift zone, in which the ions have an oscillating forward motion, leads to a gradual departure of the ions from the conductor surface. The life time of the space charge in the drift zone, according to experimental data,

may attain 25 periods (0.5 sec) from the moment of its evolution for a source frequency of 50 cycles.

"2. The maximum radii of the space charge escape front are determined for one, 3, and 5 half-life periods of the ions.

"3. The approximate stability of the front's velocity (and consequently the potential at the front) for the ion traveling wave was established in the time intervals of corona glowing." (U)

TITLE: On the Critical Gradients of a Corona Discharge. (K voprosu o kriticheskikh gradiyentakh korony. Russian)

PERIODICAL: Zhurnal Tekhn.Fiz.1957, Vol 27, Nr 2, pp 413-417 (U.S.S.R.)
Received: 3 / 1957 Reviewed: 4 / 1957

ABSTRACT: POPKOV criticizes TIKHODEEV and ALEKSANDROV because, though describing statements as wrong, they make no statement themselves as to the problem of the critical gradient E_{kr} . POPKOV then shows that neither the raising of the problem concerning E_{kr} nor the manner in which it was dealt with are connected in any way with the experiments carried out by PIK. The essential points concerning the statements made in T 25, Vol 13 on the paper by L.E.TSYRLIN in Zhurnal Tekhn.Fiz. 25, Vol 10 are the following: If an equation which is only an approximation to a physical process is compared with an experiment, the E_{kr} obtained from such a comparison can, because of the inaccuracy of the equation, be looked upon only as a computation parameter of the equation and not as a physically substantiated quantity as long as E_{kr} has not been independently confirmed. As the next point POPKOV maintains that the investigation of the field of the bipolar corona carried out by himself with the aid of probes does not confirm the assumption of the predominance of the positive space charge in the exterior zone and the inferior part played

Card 1/2

On the Critical Gradients of a Corona Discharge. PA - 2143

by recombination of the ions, and that it established the fact of a rather symmetric distribution of the density of both positive and negative ions as well as the essential part played by their recombination. He was able numerically to estimate the ratio of the density of both positive and negative ions and thus also to attempt evaluation of the decrease of E_{kr} . This also led to the conclusion that E_{kr}^+ decreases more than E_{kr} . The E_{kr} determined as well as computations carried out according to the equation (1) agree with the predictions of the hypothesis of N.A.KAPTSOV. Therefore, the determination of E_{kr} from the experiment on the basis of an approximated equation is absolutely not the only source of the knowledge obtained with respect to this quantity. It is further shown that the difference of opinion with respect to E_{kr} is purely of a numerical nature. In conclusion it is said that any conclusions drawn as to the "incorrectness" of the hypotheses investigated are without foundation. Institute for Energies "KRZHIZHANOVSKIY, Moscow

PERIODICAL: Vestnik Akademii Nauk SSSR, 1958, Nr 5, pp 29-31 (USSR)

ABSTRACT: I. V. Tyurin, Member, Academy of Sciences, USSR devoted his speech to some results of activity of the Soil Institute imeni V.V. Dokuchayev. A. L. Kursanov, Member, Academy of Sciences, USSR spoke on the participation of the AS USSR in the international exhibition 1958 in Brussels. K. V. Ostrovityanov, Member, Academy of Sciences, USSR spoke on some success in the field of social sciences, but at the same time also pointed out a certain backwardness. V. V. Belousov, Corresponding Member, Academy of Sciences, USSR reported on the participation of Soviet scientists in the works of the Geophysical Year. V. I. Popkov, Corresponding Member, Academy of Sciences, USSR, emphasized the importance of the works of the Institute for Power Engineering imeni G. M. Krzhizhanovskiy. G.A. Chebotarev, Director of the Library of the AS USSR spoke on the participation of this collective in the establishment of a large academic library in No-

vosibirsk. V. G. Bogorov, Director of the Institute for Oceanology, emphasized the importance of the oceanographic research works. V. V. Vinogradov, Member, Academy of Sciences, USSR, severely criticized the deficiencies in the development of social sciences in the AS USSR, and he emphasized the difficulty of publishing studies. V. A. Ambartsumyan, Member, Academy of Sciences, USSR reported on important problems of the development of Soviet astrophysics. V.A. Engel'gardt, Member, Academy of Sciences, USSR emphasized the unsatisfactory position of the institutes in the department for biological sciences. Ye. M. Zhukov, Corresponding Member, Academy of Sciences, USSR spoke on achievements, shortcomings and tasks of social sciences. A. I. Nazarov, Director of the Publisher of the AS USSR spoke on serious difficulties in the work of this publisher, where he also criticized those institutes which send to the press blown-up and unfinished material. V.F. Kuprevich, Corresponding Member, Academy of Sciences, USSR spoke on important tasks of biological science and emphasized the necessity of training young physicists and chemists for this work, in which he was supported by R.D. Obolentsev, Chairman of the Presidium of the Bashkiriya Branch. A. V. Sidorenko, Chairman of the Pre-

PHASE I BOOK EXPLOITATION SOV/5494

Vasil'yev, Mikhail Vasil'yevich, and Sergey Zacharovich Gushchev
Reportazh iz XXI veka; my zapisali raskazy dvadtsati devyati
sovetskikh uchennykh o nauke i tekhnike budushchego (Reports
from the Twenty-First Century; Stories of the Future) (Moscow)
Sovetskaya Nauchno i Inzhenering of the Future, 1958. 243 p. 50,000 copies printed.
Izd-vo Sovetskaya Nauka, 1958.

Ed.: V. A. Golubkova; Tech. Ed.: G. I. Kleyeva.
PURPOSE: This book is intended for the general reader.
COVERAGE: The book contains 27 articles (told reporters by
Soviet scientists) dealing with probable future progress in
Physics, chemistry, electricity, metallurgy, engineering,
Agriculture, medicine, biology, agriculture, attention is given to
application of space, and photography, attention is given to
automation, automatic underground exploitation of coal, use of
new metals, modernization of oil fields, atomic electric stations,
production of metal parts by the process of explosion, explosions

TITLE:

Field Investigation of an Alternating-current Corona by Means of a Search Electrode

PERIODICAL:

Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1959, Vol 23, Nr 8, pp 980-988 (USSR)

ABSTRACT:

A short theory of investigation by means of a search electrode is given in the present paper. A differential search electrode consisting of two similar electrodes is first described. The authors demonstrate how the discharge is not influenced by the probe, and discuss the whole measuring arrangement with the help of figure 1. In the following, the volt-ampere characteristic of the differential search electrode is discussed. The diagrams of figures 3 and 4 illustrate the volt-ampere characteristics for eight different angles. The influence exerted by space charge upon the mobility of the ions and the amount of the spatial potential are determined from the characteristic. The diagram of figure 9 illustrates the maximum space-charge density in dependence upon the distance. The diagram of figure 10 shows the spatial potential for various
