Univ., Szeged. *Pharmakologie der Aminoketone. III. Vergleichende Untersuchungen mit Largactil (3-Dimethylaminopropyl-3-chlor-10-phenothiazin), Pacatal (N-Methyl-piperidyl-3-methyl-phenothiazin) und F-933 (1-Piperidinomethyl-benzodioxan). Pharmacology of aminoketones. III. Comparison with chlorpromazine, 10-[(1-methyl-3-piperidyl)methyl]phenothiazine and piperoxan ACTA PHYSIOL. ACAD. SCIENT. HUNG. (Budapest) 1957, 11/1 (95-107) Graphs 6 Tables 3

Aminoketones with antinicotic action and adrenalytic effect reduce body temperature in rats and mice. The administration of narcotics (morphine and similar compounds) with aminoketones results in rapid cooling at an environmental temperature of 8°C.; in normal animals cooling does not occur at this temperature.

5349 CONT.

Narcotics raise body temperature when administered at room temperature but this effect is prevented by aminoketones. Some aminoketones potentiate the analgesic action of narcotics and ether. The increase in metabolic rate caused by various drugs is obliterated. Aminoketones with antinicotinic action are stated to be central ganglion-blocking agents.

"Pharmacology of a New Neuroleptic Compound, N,N¹-Di(Piperidinomethyl)-3,3'-Diindolyl-Methane"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol 29, No 3-4, 8 Jun 1966, pp 299-317.

Abstract: [English article] The title compound causes catalepsy, hypothermia, and reduction in metabolic rate even at low doses (3-5 mg /kg) in rabbits, cats, and dogs. The effect develops slowly and lasts several days. In anesthetized cats it reduces respiration rate, blood pressure, and inhibits carotid sinus pressor reflex. The vasomotor response to carbon dioxide remains. It has no antihistaminic, adrenolytic, antiacetylcholine, or antinicotinic effect. It does not paralyze the autonomic ganglia but blocks polysynaptic spinal reflexes. The analgesic effect is more effective than that of morphine. The compound potentiates ether, Evipan, and chlorpromazine. It synchronizes the cerebral electrical activity. 26 references, including 5 German, 9 Hungarian, and 12 Western. TITLE: Tonic expiratory vagal afferent fibres from the pulmonary stretch receptors 22

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 27, no. 2, 1965, 125-133

TOPIC TAGS: biologic respiration, muscle physiology, nervous system, neurology

ABSTRACT: The physiological properties of fibers from pulmonary stretch receptors, isolated from the cervical vagus of cats anesthetized with chloralose-urethane, curarized and artificially ventilated, have been studied. 1) In 23 per cent of the isolated fibers, the activity did not cease during the respiratory interval. 2) The activity during this interval depended on the duration, volume and frequency of the preceding inflations. 3) Changes in the blood oxygen and carbon dioxide content do not influence the activity of the fibers during the respiratory interval. 4) An insufficient inflation of the lungs does not explain the activity under review. The fibers remain active in cases of pneumothorax and the activity remains under the influence of the factors

Card 1/2

ACC NR: AT6023526

specified under(2). 5) Since discharges cease in the examined fibers when the air is sucked out from the lungs, the receptors of these fibers appear to be stretch receptors with a very low threshold value. 6) It is suggested that the inhibition is due to post-excitation depression. 7) Since the fibers (receptors) under consideration presumably have the function to inhibit the respiratory center and since they remain active during the interval between two respirations in eupnea, the use of the term "tonic expiratory fibers" (receptors) is suggested to distinguish them from the stretch receptors which are active during inflation only (phasic expiratory receptors). 8) The physiological function of the tonic expiratory fibers is to facilitate the inhibitory effect of the phasic expiratory receptors on the respiratory center. TITLE: Aminoethane and ethene derivatives having a curare effect

SOURCE: Kiserletes Orvostudomany, v. 17, no. 1, 1965, 43-50

TOPIC TAGS: biochemistry, experiment animal, drug effect, pharmacology

ABSTRACT: It has been shown that 1-piperidino-2-phenyl-ethane (FMP-199) and 1-piperidino-2-phenyl-ethene (FMP-228) have an elective curare-like effect on cats, rabbits, mice, and frogs. They have practically no muscarine and nicotine-like effects. The curare-like activity is elicited by depolarization of the motor endplates. This is indicated by the fact that they cause fibrillar spasms and the blocking of the myoneural transmission can not be inhibited by prostigmine. According to the data, curare-like activity is present in such compounds which contain one tertiary N atom in which a phenyl radical is located at 4.6-5 Å distance from it. This ring is definitely needed for the effect since 1-N-piperidino-butane,

Title : The Clinical-Anatomical Study of the Pathogenesis of
Thymus Death

Orig Pub : Magyar belorv. archivum, 1955, 8, No 4, 116-122

Abstract : A sudden death in the Status thymicolumphaticus is related to a shock as a result of storage in the organism of large amounts of acetylcholine due to a strong increase in the function of the thymus (T) which paralyzes the activity of cholesterinase. Due to the hypofunction of the adrenals as a result of their hypoplasia, the shock cannot be counteracted. The injection of T extracts lowers the blood pressure in cats and rabbits,

✓ 2558. Cardiovascular and respiratory effects of capsaicin. J. Pórszász, L. György, and K. Pórszász-Gibiszer *Acta physiol. Acad. Sci. hung.*, 1955, 8, 61-76.—Capsaicin [caps] injected i.v. in high doses (200 µg./kg.) causes, in both dogs and cats, a fall in blood pressure. (A Bezold-Jarisch reflex.) Caps injected i.v. in small doses into cats has a strong vasopressor effect of peripheral character, also present in decapitated animals and in the presence of ganglionic blocking agents. It has such effect in the dog. It increases respiratory rate in both animals. On intracarotid injection caps exerts a strong vasoconstrictor effect due to a direct excitation of the vasomotor centre. It also stimulates respiration. This latter effect is present after anaesthesia of the carotid chemoreceptor area. It is a more powerful stimulant of the respiration than lobeline. On intracisternal injection in doses of 2-2 µg./kg. it is a strong respiratory stimulant and vasoconstrictor substance. Ganglionic blocking agents inhibit the latter effect. (Hungarian)

ABSTRACT: The neural connection between the hypothalamic depressor area and the vaso-
depressor area of the medulla oblongata has been studied in the cat. It was found
that the fall in blood pressure, evoked by hypothalamic stimulation, failed to develop
after dorso-ventral division of the medulla oblongata, at the height of the facial
cranial nerve, over a width of 2-3 mm on both sides of the center line. Transection
of this kind does not impair the effect of hypothalamic pressor impulses nor does it
paralyze the vasomotor center. Presumably, there is a direct neural connection be-
tween the hypothalamic depressor area and the vasodepressor area of the medulla oblon-
gata. It is suggested that the depressor area constitutes a vasodepressor reflex cen-
ter which receives impulses both from the periphery and from the higher nervous
centers. Orig. art. has: 4 figures. /Orig. art. in Eng./ [JPRS]

AUTHOR: Port, Miroslav

TITLE: Generator relay for internal combustion engine

PERIODICAL: Referativnyy zhurnal, Silovyye ustavovki, no. 24, 1962, 51, abstract 42.24.354 P. (Czech. pat., cl. 21c, 52, no. 99285, April 15, 1961)

TEXT: Instead of contacts in the current limiting relay of the generator of an internal combustion engine working at varying rpm, it is proposed to install silicon diodes 3 (see figure) connected to the excitation winding 2 of the generator 1. The diodes block the circuit until a given voltage is reached, after which they pass the current; at the same time some of the ampere turns of the winding are cut out, and the voltage of the current at the generator terminals decreases. A buncher can be connected into the network. There is 1 figure.

A. Zhukov

TITLE: Concerning integro-differential equations for distributions of probabilities
of additive functionals from diffusion processes

SOURCE: Ukrainskiy matematicheskiy zhurnal, v. 18, no. 5, 1966, 60-68

TOPIC TAGS: integrodifferential equation, partial differential equation, functional
equation

ABSTRACT: The problem of finding the distribution of probabilities of an additive
functional from a diffusion process is considered. An integro-differential equation is
obtained for the characteristic function of the functional. This equation is a general-
ization to a wider class of the functionals involved in the well known results of M.
Kac and E. B. Dynkin. A theorem concerning the existence and uniqueness of the solu-
tion of the equation obtained is proved. Conditions are found under which the integro-
differential equation is equivalent to a certain partial differential equation. The
author expresses gratitude to I. I. Gikhman, Corresponding member of the AN UkrSSR,
for constant attention to the work. Orig. art. has: 9 formulas.
