AUTHOR: Postnov, V. A.

TITLE: Sizeable Deflections of a Plate in a Specific Case Where the Edges of the Supported Periphery are Restrained Asymmetrically in Relation to the Center of the Plate (Bol'shiye progiby plastiny dlya odnogo chastnogo sluchaya nesimmetrichnogo, otnositel'no tsentra, zakrepleniya kromok opornogo kontura)

PERIODICAL: Tr. Leningr. korablestroit. in-ta, 1955, Vol 16, pp 21-33

ABSTRACT: On the basis of the Kármán equations the author studies the stability of finite deflections of a plate supported freely along three sides and clamped along the fourth. The deflection is given in the form of the series

$$w = \sum_{n=1}^{n=\infty} \sum_{m=0}^{m=\infty} A_{mn} (\cos \beta_{2m+1} y - \cos \beta_{2m+3} y) \sin \alpha_n x$$

Card 1/2 where  $\alpha_n = n\pi/a$ ,  $\beta_k = k\pi/b$ , and where  $x$  is the direction parallel to

SOV/124-57-8-9327

Sizeable Deflections of a Plate in a Specific Case Where the Edges of the (cont.)

the restraint  $y$  is perpendicular to it, and  $a$  and  $b$  are the side lengths; it is assumed here that the boundary conditions for the deflection of the plate are satisfied. In such a case the stress function is determined from the compatibility equations and the coefficients of such a function are expressed in the form of a quadratic function of the parameters  $A_{mn}$ . The equilibrium equation is solved by the Bubnov-Galerkin method, and a system of cubic equations is obtained which determine the desired deflection parameters  $A_{mn}$ . As an example the author makes a separate calculation for one specific term of the series ( $A_{mn} - A_{01}$ ). Graphs are constructed for the reduction coefficient of a plate compressed by greater than critical stresses.

TITLE: "Mikhail Lomonosov" - a New Expeditionary Ship (Novoye ekspeditsionnoye sudno "Mikhail Lomonosov")

PERIODICAL: Priroda, 1957, No 10, pp 108-109 (USSR)

ABSTRACT: In connection with the International Geophysical Year, the article describes the expeditionary ship "Mikhail Lomonosov" which is owned and being used by the Marine Institute of Hydrophysics of the AN USSR. The ship was built at the "Neptun" shipyard in the SZG in 1957 according to a project of the Department of Marine Expeditionary Works of the AN USSR. It has a displacement of 6,000 tons and is 102.4 m long and 14.4 m wide. It develops a speed of 13 knots and can spend 35 days at sea without refueling, i.e. can make 11,000 miles without calling a port. There are 16 laboratories aboard furnished with the latest scientific equipment and excellent cabins to accommodate both scientists and crew. The ship has a deep sea anchor capstan with a 15,000 m long chain-cable. Aboard the ship are 2 motor launches, each developing up to 9 knots and capable of staying at sea for 5 days without refueling. For scientific purposes, the ship is equipped with 8 hydrological capstans of the "Okean" type. 1 deep sea trawling capstan

Card 1/2

"Mikhail Lomonosov" - a New Expeditionary Ship

26-10-26/44

with a 7,000 m cable for trawling in depths of up to 4,000 m and also 3 sounding devices, 2 of which are suitable for depths of 5,000 m and 1 for 10,000 m. The steamer has a fine steering gear and is of excellent maneuverability. In the research work aboard ship will participate more than 60 scientists from the Marine Institute of Hydrophysics of the AN USSR, the Moscow State University, the Institute of Oceanology of the AN USSR, the Institute of Earth Magnetism and others. According to the internationally approved plan, the scientists aboard the "Mikhail Lomonosov" will conduct research at the 5 southern standard stations of the North Atlantic. The program comprises: the study by various methods, among them by radio-sounding, of atmospheric processes above the North Atlantic, the origin of cyclones and anticyclones, investigation of the ocean bottom relief features and of the geological structure of bottom sediments, the inquiry into magnetic fields, the salinity of water, the pulsation of temperature and the distribution of zoo- and phyto-planktons in the North Atlantic, etc.

**Kyshtymite from the Il'men Mountains.** K. I. Postov (Il'men State Admin.) *Zapiski Vsesoyuz. Mineral. Obshch.* (Il'men Soc. Min. Mineral.) **80**, 291 (1951).

Corundum-bearing pegmatites and syenites have been previously described in the Il'men Mts., but kyshtymite was unknown before. It is found in cluvial boulders on the western beach of Lake Argari, about 10 km. south of the famous Borzova deposit, and 60 km. south of the corundum plagioclases of Kaslin. The geol. nature of the rock may be similar to that of the deposits mentioned, i.e. assocd. with tremolite-anthophyllite rocks, garnet-amphibolites, of sometimes skarnlike habit (with scapolite and epidote). Rather frequently, relict ultrabasic inclusions of olivine-orthopyroxene rocks are observed. The characteristic mineral assocn. is in the kyshtymite-plagioclase (anorthite or bytownite), spinel (dark-colored pleonast, with  $n = 1.765$ ), and corundum with crystals of max. 2-cm. diameter, with typical parallel-oriented intergrowths of sillimanite. The chem. analysis of the rock shows 69.71%  $Al_2O_3$ ; 9.11%  $Fe_2O_3$ ; 0.6-1.4%  $FeO$ ; 4-4.3%  $CaO$ ; 3.3-4.9%  $MgO$ ; alkalis subordinate. Assocd. with the kyshtymite is poikilitic plagioclase-spinel rock of diablastic type, most probably only a contact facies. Margarite and vermiculite rocks which are typical for the corundum-plagioclase deposits are, however, entirely absent.

TITLE: A Standardized Approach to the Analysis of Local Welding Deformations on the Hull of a Ship (Normirovaniye mestnykh svarochnykh deformatsiy korpusa sudna)

PERIODICAL: Tr. Tsent. n. -i. in-ta rech. flota, 1955, Nr 31, pp 50-86

ABSTRACT: It is assumed that for small deformations from a plane the flexural deflection  $w_0$  be expressed by the equation  $w_0 = B l^2$  in terms of the distance  $l$  between rigid structural elements, where  $B$  is a constant quantity dependent on the fabrication technique. Tables have been composed for values of  $B$  from a large number of shop observations. Calculations are given for the deformations that are to be expected, namely, the flexures and the contractions within the plane of the rib assembly resulting from the shrinkage of the welding seams, the angular deformations resulting from the nonuniform distribution of the plastic deformations throughout the thickness of the sheets, and the buckling due to loss of stability of the sheets during their welding onto the assembly. It is assumed that the

Card 1/2

124-51

A Standardized Approach to the Analysis of Local Welding (cont.)

shrinkage deformations evoke internal stresses within the region of the welding seam that may be examined as external tangential stresses, so far as their effect on the external plating is concerned:

$$\tau_1 \sin 2\pi y/b \quad \text{for } x = \pm a/2$$

$$\tau_2 \sin 2\pi x/a \quad \text{for } y = \pm b/2$$

where  $a$  and  $b$  are the dimensions of a plate element. The flexural deflection is then found as  $w = w_0 \cos \pi x/a \cos \pi y/b$ . The nonlinear equation of the compatibility of the deformations is integrated exactly, wherein the boundary conditions are satisfied by the assumption that the plate element is freely supported along the full length of its four edges and that the edges remain straight and within the plane of the plate element. The equation of equilibrium is integrated by Bubnov's method and the relationship of  $w_0$  versus the magnitude of the contraction between the transverse and longitudinal edges is thereby determined. The effect of the local deformation on the overall strength of the ship hull is examined in accordance with well-known methods [ Papkovich, P. F., *Stroitel'naya mekhanika korablya*, Ch. II (The Structural Mechanics of the Ship, Part II), Sudpromgiz, 1941 ].

Graphs and tables indicate the maximum permissible magnitudes of the local deformations for some types of naval structures. Kh. M. Mushtari

REF SOURCE: Tr. Leningr. korablestroit. in-ta, vyp. 49, 1965, 55-56

TOPIC TAGS: shipbuilding engineering, bending strength, bending stress, SHELL  
STRUCTURE

ABSTRACT: The deflection of the bottom shell and inner plating, together with several cross-members and a fairly large number of floors, is analyzed. The plating consists of a system of two parallel plates joined by floors and stringers, the plates of which are considered as a certain filler layer of a uniform and continuous rigidity of displacement in the direction of the oy-axis and a distinct rigidity in the ox-direction. The assumption is made that the shell and inner bottom plating follow the Kirchhoff-Love law, and that the floor and stringer plates follow the hypothesis of a straight line. The differentiation method is used for plotting the general differential equations. An exact integration of the obtained system for determining the bending moments of the plating can only be made for the condition of plates freely supported on transverse bulkheads.

TITLE: Certain properties of ferrocene diazo compounds

SOURCE: AN SSSR. Doklady, v. 159, no. 6, 1964, 1334-1337

TOPIC TAGS: ferrocene diazo compound, ferrocenyldiazonium cation, reactivity

ABSTRACT: The chemical properties and reactivity of the ferrocenyldiazonium cation (A), obtained by acidolysis of benenediazoaminoferrrocene (B), were investigated. It was determined that A was less active than the phenyldiazonium cation in nitrogen coupling reactions due to the greater nucleophilicity of the ferrocene in comparison to benzene. The acidolysis of B is a reversible reaction: treatment of the reaction mixture with pyridine gave the initial triazene. A reacted with diethylamine to form 3,3-diethyl-1-ferrocenyltriazine; with a mixture of methyl-aniline and pyridine it formed 3-methyl-3-phenyl-1-ferrocenyltriazine; and with  $\beta$ -naphthylamine, A formed  $\beta$ -naphthalenediazoaminoferrrocene,

Card 1/2

L 35539-55

ACCESSION NR: AP5001993

$\beta$ -C<sub>10</sub>H<sub>7</sub>-N=N-NHC<sub>6</sub>H<sub>4</sub>FeC<sub>5</sub>H<sub>5</sub>. The latter did not give A upon treatment with concentrated HCl. B reacted fairly rapidly with  $\beta$ -naphthol at 100C to form 1-ferroceneazo-2-naphthol, and with acetylacetone to form 3-ferrocenyldiazoacetylacetone. B reacted more slowly with acetoacetic ester to form the  $\alpha$ -ferrocenyl-hydrazonoacetoacetic ester and its anilide

Reaction of B with acetoacetic acid anilide, however, gave the  $\beta$ -anilanilide  $\text{CH}_3\text{C}(=\text{NC}_6\text{H}_5)\text{C}(=\text{NNHC}_5\text{H}_4\text{FeC}_5\text{H}_5)\text{CONHC}_6\text{H}_5$ . An aqueous solution of the potassium ferrocenyldiazotate was obtained by slowly mixing ferrocenyldiazonium chloride and KOH at -30 to -20C and then heating slowly. Orig. art. has: 3 equations

3228. CUTANEOUS CHANGES IN RHEUMATIC FEVER (Russian text) - Post-nov Y. V. - ARKH. PATOL. 1959, 21/2 (19-27) illus. 7  
Organs and skin of 36 autopsies were examined. Of these, 5 men and 23 women had died from rheumatism, in 7 subjects accompanied by endocarditis, in 16 by rheumatic granulomatous myocarditis and in 5 by myocarditis only. In the acute stage, even if no external changes had been observed, the skin contained small fibrinoid foci with a proliferative reaction in the connective tissue and inflammatory phenomena in the vessels. The latter were also observed in the vessels of the internal organs. A histiocytic reaction with increase in the number of mast cells was particularly striking. In the nervous apparatus dystrophic phenomena of the nerve fibres of the skin, up to disintegration of axon cylinders, were observed during the acute stage; afterwards regenerative phenomena set in, subsequent to atrophy of the nerve fibres.

SOURCE: Okeanologiya, v. 5, no. 6, 1965, 1084-1088

TOPIC TAGS: wind, wind velocity, wind meter, anemometer, oscillograph

ABSTRACT: In the study of the characteristics of wind flow <sup>9M</sup> by different instruments the problem arises of the comparability of the results obtained by these instruments. The Marine Hydrophysical Institute has made repeated measurements of mean wind velocity and its fluctuations with a sensor in the form of a platinum filament with a diameter of 0.02 mm, recorded on the tape of a magnetoelectric oscillograph, and a cup anemometer with recording on an oscillograph tape. Using the thermoanemometer, with an inertia of about 0.01 sec, it was possible to obtain records of fluctuations of wind velocity with a frequency approximately up to 10-30 cps, while by means of cup anemometers with an inertia of about 1 sec it was possible to record wind velocity fluctuations with an upper frequency limit of several tens of cps. This article reports on the comparison of the results of the two instruments as used in the coastal zone of the Black Sea in September 1960. Measurements were made 2 m above mean sea level. The autocorrelation functions method was used in the comparison. The analysis shows that the autocorrelation functions and the characteristics

TITLE: Fluctuations of heat balance in the tropical zone of the Atlantic Ocean (from data of the 12th voyage of the Russian research ship Mikhail Lomonosov)

SOURCE: AN UkrSSR. Morskoj gidrofizicheskiy institut. Trudy, v. 35, 1966.

Gidrofizicheskiye i gidrokhimicheskiye issledovaniya tropicheskoy zony Atlantiki (Hydrophysical and hydrochemical research in the tropical zone of the Atlantic), 31-41

TOPIC TAGS: heat balance, solar radiation, evaporation, research ship,

*oceanography*

ABSTRACT: This paper is a reconnaissance survey of the heat balance observed along the route of the Russian research ship Mikhail Lomonosov during its 12th voyage from 15 October to 26 December 1962. The area of study lies between 55° N. Lat. and 22° S. Lat. and between 5° E. Long. and 41° W. Long. Data are also compared with earlier voyages of the same ship. The elements considered are expressed in the formula for heat balance employed by the authors

$$B = q - \Delta q - q_s - q_c \pm q_e$$

where  $q$  is the amount of heat falling each second on a square meter of ocean surface

Card 1/2

ACC NR: AT6035085

as a result of direct and scattered solar radiation,  $\Delta q$  is the amount of heat lost per second from each square meter of ocean surface through reflection of incident solar radiation,  $q_r$  is the amount of heat lost each second per square meter through long-wave radiation,  $q_e$  is heat loss through evaporation, and  $q_c$  is heat loss through contact heat exchange with the surface layer of air. Analysis of daily fluctuations in heat balance of the ocean and consideration of the various components show that two components are fundamental in changing the heat balance of the Atlantic in the tropical belt--the total radiation reaching the ocean surface from the sun and the loss of heat by evaporation at the ocean surface. The amount of radiation loss in this region ranges between rather narrow limits because of the thick layer of water vapor above the ocean. The authors plan to use the data from the 12th voyage in combination with a compilation of data from the other voyages to arrive at a clearer picture of details in changes of heat balance over the Atlantic. Orig. art. has: 4 figures, 1 table, and 5 formulas.

Feverish Animals in Cases of Chilling.Orig Pub : V sb.: Ezhegodnik. In-t eksperim. med. akad. med. nauk  
USSR, 1955, L., 1956, 128-132.

Abstract : In healthy and feverish rabbits, the rate of hypothermic development was investigated during severe doses of chilling. In one series of experiments in feverish animals after the introduction of *B. mesentericus* (in a dosage of 2 ml/kg), chilling for the course of 30 minutes at a water temperature of 16° caused a drop of the rectal temperature to 3.4° on the average, while in healthy animals - to 4.4°; the O<sub>2</sub> requirement increased 46.8%, while in healthy animals - 65%. The primary temperature level in both groups

TITLE:

Growing of lanthanum ethyl sulfate single crystals with  
gadolinium- and cerium ethyl sulfate impurities and  
some of their physical properties

PERIODICAL:

Ukrayins'kyy fizychnyy zhurnal, v. 7, no. 1, 1962,  
22 - 29

TEXT: The method of preparation, growing technique and measurement  
of the dielectrical constants of lanthanum ethyl-sulfate with gado-  
linium- and cerium ethyl-sulfate impurities, is described. These cry-  
stals are paramagnetic substances of which ultra-high fre-  
quencies can be amplified. The salts of the rare-earth elements of  
ethylsulfuric acid were prepared by mixing equivalent amounts of the  
rare-earth element sulfate and barium ethylsulfate in a solution. The  
single crystals were grown by gradually cooling the saturated solu-  
tion, over a period of 10 - 12 days; the crystals were 15 - 20  $\mu$ m.  
Card 1/3

Growing of lanthanum ethyl sulfate ...

long and 12 - 15 mm thick. It is important to properly select the rate of temperature decrease, as at high rates an opaque solution is formed and the crystal becomes inhomogeneous. The shape of the crystals depends on the concentration of the solution; thus, some of the crystals were hexagonal prisms and (with higher gadolinium-ethyl sulfate concentration) others were hexagonal double-pyramids. The crystals grown from pure solutions were stable in air and in a vacuum, during repeated cooling from room temperature to that of liquid helium, followed by heating to the original temperature. The dielectric constants (permittivity  $\epsilon'$  and the tangens of the dielectric-loss angle  $\text{tg } \delta = \epsilon''/\epsilon'$ ) were measured at a frequency  $f$  of 9000 Mc, over a temperature range of 290 - 4.2°K. In the literature, no such data were previously given. The method of measurement was based on the perturbation of the resonator through introducing small-size specimens into its high-frequency field. This permitted measuring at each temperature point the perturbed and unperturbed values of the natural frequency and Q-factor of the resonator by simply moving the specimen from the region with maximum field-strength to that where the field practically vanishes. The permittivity  $\epsilon'$  va-

COUNTRY : Rumania  
 CATEGORY : Forestry. Dendrology.  
 ABS. JOUR. : RZHBiol., No. 14 1959, No. 63193 X  
 AUTHOR : Postolache, Victor  
 TITLE : A New Occurrence Site of Euonymus latifolia Will. in Poiana Marului  
 ORIG. PUB. : Rev. padurilor, 1956, 71, No. 9, 611  
 ABSTRACT : The discovery of a new occurrence site of E. latifolia is reported, in the forestry Ruska Montana, Timiscara regiune (Rumania), 1000-1200 m above sea level on rich, fresh loose soils. The spindle tree grows in curtains on the open areas or under the canopy of old beech and fir stands, where it reaches a height of 5 m. The species composition of the stands with spindle trees and an inventory of the species composing the soil cover are presented.--i. Yaca
