Orig Pub : Prace Inst. elektrotechn., 1958, 7, No 21, 130-139

Abstract : The construction of a salinometer developed by the Electrotechnical Institute (Warsaw) is described. The range of measurements of the device is from 0 to 10 and from 0 to 50 mg/l of NaCl. The feeder of the device is either mounted on the piping system or in a separate casing. The measuring system represents an unbalanced bridge of alternating current with semiconductive rectifiers connected in series. The apparatus has devices

Puczyński K. The Sinking of Reinforced Concrete Units (Retention and Sedimentation Tanks etc.) below Subsoil Waters.

„Zapuszczanie żelbetowych konstrukcji (zbiorników, osadników itp., ponizej wody gruntowej”. Gospodarka Wodna, No. 4—5, 1951, pp 169—173, 5 figs.

Detailed review of a number of typical instances of sinking tanks in soil containing underground waters. The units in such instances are prefabricated, either in parts or complete (without bottom), in the excavation above the subsoil waters and then sunk to below the subsoil water level. Next follow the successive stages of completing the upper structural parts above the water line, and the setting of the complete unit in concrete below the water line represents the final phase of the work. Methods of sinking the tanks. It is essential, in view of the extensive scope of work envisaged by the Six-Year Plan, to complete as early as possible the designs of types adapted to certain of the more typical conditions prevalent at working sites.

ACCESSION NR: AP3007087

AUTHOR: Galeev, A. A.; Pudakov, L. I.70
68TITLE: Nonlinear theory of drift instability of inhomogeneous plasma in a magnetic field

SOURCE: Zh. eksper. i teoret. fiziki, v. 45, no. 3, 1963, 647-655

TOPIC TAGS: plasma drift instability, turbulent diffusion coefficient, plasma escape, plasma instability, turbulent plasma, inhomogeneous plasma, magnetic field confined plasma

ABSTRACT: A weakly turbulent plasma, with turbulence due to the essential instability of inhomogeneous plasma, has been investigated. In an unstable plasma the level of electric-field fluctuations can exceed the thermal background, thus causing an increase in plasma flow across the confining magnetic field. The boundary instability of plasma confined by a magnetic field rapidly damps out, if collisions between particles can be neglected. Otherwise, a tendency toward an unstable Maxwell distribution of velocities

Card 1/2

L 18489-63
ACCESSION NR: AP3007087

arises. The qualitative evaluation of this phenomenon was based on the instability increment obtained from the linear theory of the Maxwell distribution function for electrons. A stationary spectrum of oscillations was calculated from the kinetic equation for waves. By means of this spectrum the turbulent flow of plasma across the confining magnetic field was evaluated. Although the computed turbulent diffusion coefficient was found to be greater than the classical value for this coefficient, it is nevertheless small in comparison with the Bohm coefficient. "In conclusion the authors express their sincere gratitude to R. Z. Sagdeev for fruitful discussion and remarks." Orig. art. has: 27 formulas.

TITLE: Determining the average change in the inverse magnitude of major semi-axis of a comet orbit due to perturbations by planets

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 8, 1962, 9, abstract 8A90 ("Uch. zap. Latv. un-t", 1961, v. 41, 103 - 106, Latvian summary)

TEXT: In the theory of diffusion of almost parabolic comets, the magnitude of the following quantity should be known:

$$D = \left[\frac{1}{2} \int_{-\infty}^{+\infty} \varphi(\delta) \delta^2 d\delta^{-1} \right] = \left[\frac{1}{2} \delta^2 \right]^{-1},$$

where $\varphi(\delta)d\delta$ is probability of changing of the major semi-axis inverse magnitude, due to planetary perturbations, by a magnitude being within the limits from δ to $\delta + d\delta$. Various authors have calculated planetary perturbations in the range v (-180°; +180°) for 16 comets. The results of these calculations corroborate

TITLE: Reactions between triphenylphosphine and fluoborides of nonsymmetrical diaryliodonium salts

SOURCE: AN SSSR. Doklady, v. 165, no. 3, 1965, 582-585

TOPIC TAGS: chromatography, organic phosphorus compound, photochemistry, boron compound, fluorinated organic compound

ABSTRACT: Fluoborides of nonsymmetrical diaryliodonium salts: m-nitrophenylphenyliodonium, p-anisylphenyliodonium, p-anisyl-m-nitrophenyliodonium, m-carbethoxyphenyl-phenyliodonium, o-nitrophenyl-phenyliodonium, and p-chlorophenyl-phenyliodonium salts, were reacted with triphenylphosphine in acetone for six to eight hours at 1:1 ratios of the initial reagents. After the reaction, the acetone was evaporated, and the residue repeatedly washed with ether to remove aryl iodides and unreacted triphenylphosphine. Then the tetraarylphosphonium fluoborides were separated from the diaryliodonium fluoboride by thin-layer chromatography. A substantial influence of polar factors was observed in the photochemical reaction between diaryliodonium fluoborides and triphenyl-phosphine: in most cases phosphonium salts were obtained only with the more electron acceptor substituent. Only in the decomposition of the p-chlorophenyl-phenyliodonium salt, in which the radicals are close in electronegativity, are the phosphonium salts obtained in almost equivalent amounts. The data obtained

Card 1/2

L 26573-66

ACC NR: AP6016976

are in good agreement with the previously proposed chain radical mechanism. The thermal reaction between triphenylphosphine and ArAr'IRF₄ (m-nitrophenyl-phenyliodonium, p-anisyl-phenyliodonium, p-anisyl-m-nitrophenyliodonium, and m-carboxyphenyl-phenyliodonium fluoborides) was investigated for comparison (heating at 97° in darkness for 10 hours in the presence of n-propanol). The data of the thermal reaction and those of the photochemical reaction between triphenylphosphine and diaryliodonium salts are practically the same. In both cases the radical with more electron-acceptor substituent is predominanatly (or exclusively) transferred to triphenylphosphine. Orig. art. has: 2 tables. [JPRS]

TITLE: Investigation of the photochemical reaction between triphenylphosphine and iodonium diphenylfluoroboride 1/1, 65

SOURCE: AN SSSR. Doklady, v. 165, no. 4, 1965, 838-841

TOPIC TAGS: chemical kinetics, solution kinetics, oxidation kinetics, chemical reaction kinetics, photochemistry, mercury lamp

ABSTRACT: The mechanism of the photochemical reaction between triphenylphosphine and iodonium diphenylfluoroboride was investigated. The investigation is an extension of previously published work of O. A. Ptitsyna, M. F. Turchinskii i dr. (Izv. AN SSSR, OKN, 1963, 1527). The effect of various solvents and reagent mixture ratios on the product yield was determined. The radiation source in all experiments was a mercury lamp PRK-4. A reaction mechanism is proposed. Orig. art. has: 2 tables and 9 equations.

PROCESSES AND PROPERTIES INDEX

Internal photoeffect in deformed crystals due to ultraviolet irradiation. IV. Casting and γ -Podlubny's F' . *J. Exptl. Theoret. Phys.* (U. S. S. R.) 9, 407-8 (1939).—From their exptl. data, G. and P. conclude that in deformed crystals the electrons are held more firmly not only in the F and F' but also in the deeper U' levels. The U' , like the F' level, seems to be related to a destruction of the crystal lattice. The greater the crystal deformation, the stronger is the increase of the reverse photocurrent under the action of ultraviolet irradiation. Cf. also Podlubny's *C. A.* 33, 4806, 5287²⁴; Fedenev, *C. A.* 33, 5287². F. H. Rathmann

800. PUDELSKI J. * Wyniki skojarzonego leczenia przeciwgružkowego chorych z jamistą gružlicą pluc. Results of combined antimicrobial therapy in patients with cavernous pulmonary tb GRUŽ-LICA 1956, 24/6 (461-472) Tables 12
147 tuberculous patients with cavernous pulmonary tb have been treated with antimicrobial agents in the tuberculosis hospital of the Ślask Medical College. Group I was given INH combined with streptomycin, group II was given INH combined with PAS, both within 3 to 7 months. The combination INH + PAS yielded better results than INH + streptomycin as to general symptoms. Sputum conversion did not differ in both groups: it was obtained in 78% of the patients with recent lesions, and in 50% of

800

CONT

the patients with the long-standing lesions, on the average in 70%. Radiological improvement was similar in both groups. The percentage of radiological improvement was much higher in recent lesions than in the old ones, regardless of the therapeutic regimen. In both groups, the percentage of radiological improvement in recent lesions was as follows: marked improvement: 40% of the cases; considerable improvement: 27%; slight improvement: 19%; no improvement: 14%. In the treatment of long-standing lesions, marked radiological improvement was obtained in 9% of the cases; considerable improvement in 9%; slight improvement in 44%, and no improvement in 38% of the cases. The highest percentage of radiological improvement was reached after the first 3 months of treatment. Closure of cavity, as seen on radiograms, was related to its character, time of duration and size. The therapeutic regimen had no influence here, while the duration of cavity before treatment had a considerable influence on its closure; recent cavities (up to 2 yr.) in both groups closed in 40% of the cases, and decreased considerably in 27% of the cases. In 33% of the cases there was no change in the size of the cavity. Long-standing cavities did not close in 26 cases, they decreased considerably in 3 cases, and closed in 3 cases. Good results obtained in hospitalized cases with recent lesions treated with antimicrobial agents emphasize the importance of early diagnosis and prompt treatment. According to the experience of this hospital, in the majority of cases the decision as to surgical treatment should not be undertaken before the first four months of antimicrobial therapy, conducted either in sanatorium or in hospital.

Abstract: [Author's English summary modified] The function
of the respiratory tract in patients with pulmonary cancer
was studied by means of both spirographic and bronchospiro-
metric tests. Whereas in cases of central cancer with no
changes of the lungs general examinations showed normal va-
lues, bronchspirometric tests revealed defective function
of the damaged lung, proportional to the degree of constric-
tion of the bronchus and extent of the tumor. Marked mal-
function was noted in pulmonary cancer patients with coexist-
ing emphysema and bronchitis, as well as in cases of general-
ized pulmonary cancer. Author finds bronchspirometric
tests most useful for the purpose. There is one Russian
and nine Western references.

"Thermal Reaction between Triphenyl Phosphine and Diphenyliodonium Fluoroboride"

Moscow, Doklady Akademii Nauk SSSR, Vol 168, No 3, 1966, pp 595-598

Abstract: A radical mechanism is proposed for the homolytic decomposition of diphenyliodonium fluoroboride in the reaction with nucleophilic reagents. The applicability of this mechanism to the formation of tetraphenylphosphonium fluoroboride during heating of triphenyl phosphine with diphenyliodonium fluoroboride was verified. The reaction conditions were varied to conduct each of the two processes, photochemical and thermal, separately. Approximately 50% yields were obtained for the separate reactions, as compared with a 90% yield for the reaction under normal conditions of the Makarova-Nesmeyanov reaction. The thermal and photochemical reactions were found to proceed according to a radical chain mechanism, not a heterolytic mechanism. In both of the separate reactions, the diphenyliodonium salt decomposes entirely, although tetraphenylphosphonium fluoroboride is obtained in only an approximately 50% yield. There is consequently a substantial "useless" decomposition of the diphenyliodonium salt, evidently due to a side reaction leading to benzene formation. Orig. art. has: 1 formula and 1 table. ORG: Kazan' State University im. V. I. Ul'yanov-Lenin (Kazanskiy gosudarstvennyy universitet)

TITLE: Reactivity of incomplete esters of phosphorus acids in reactions of addition to acrylonitrile

SOURCE: Zhurnal obshchey khimii, v. 36, no. 6, 1966, 1113-1118

TOPIC TAGS: acrylonitrile, organic phosphorus compound

ABSTRACT: The comparative reactivities of a number of phosphorus-containing reagents with a labile hydrogen atom: dialkylphosphorous and dialkylthiophosphorous acids, incomplete esters of phosphorous acids, diethylidithiophosphoric acid, cyanophosphonemethane, and phosphoneacetic ester were investigated in the reactions of addition to acrylonitrile. Two methods of investigation were used: the method of "competitive" addition and the construction of kinetic curves, reflecting the dependence of the degree of completion of the reaction upon the time. In the first method, acrylonitrile and two of the phosphorus-containing components tested were brought together in equimolar ratios in the absence of a solvent, using a saturated solution of sodium ethylate in anhydrous alcohol as the catalyst. On completion of the reactions, the reaction mixtures were distilled under vacuum, and the amounts of addition products formed were determined. Kinetic curves of the reactions with acrylonitrile were taken in ter-butanol:dioxane (10:1) solution at constant temperature,

Card 1/2

1192

L 06513-67
ACC NR: AP7000479

with potassium ter-butylate as the catalyst. The reaction was monitored by determining the unreacted acid or unreacted acrylonitrile. The following order of decreasing reactivity of dialkylphosphorous acids in addition to acrylonitrile was determined: $(\text{CH}_3\text{O})_2\text{POH} > (\text{C}_2\text{H}_5\text{O})_2\text{POH} > (\text{n-C}_3\text{H}_7\text{O})_2\text{POH} > (\text{iso-C}_3\text{H}_7\text{O})_2\text{POH} > (\text{n-C}_4\text{H}_9\text{O})_2\text{POH} > (\text{iso-C}_4\text{H}_9\text{O})_2\text{POH}$, indicating a substantial influence of

the steric factor, shielding of the phosphorus atom, leading to a decrease in its reactivity. A further investigation with various types of incomplete esters of phosphorus atoms, containing only ethyl radicals, eliminated the influence of steric factors. Diethylthiophosphorous acid was found to be the most reactive, followed by the ethyl ester of ethylphosphinous acid, diethylphosphorous acid, and finally di-(beta-chloroethyl)phosphorous acid. The reactivity of these acid esters was determined by the basicity of the trivalent phosphorus atom, in turn directly dependent upon the inductive influence of the groups surrounding it. Orig. art. has: 4 figures and 1 table. [JPRS: 37,023]

"Thermal Isomerization of Diethylacetylphosphite"

Moscow, Zhurnal Obshchey Khimii, Vol 36, No 5, 1966, p 951

Abstract: Heating of diethylacetylphosphite at 160-170° for five to six hours resulted in a 50% yield of methyldi(diethylphosphone)carbinol acetate. This product was found to be identical to the acetate synthesized from methyldi(diethylphosphone)carbinol and acetyl chloride. A two-step reaction mechanism is proposed: when diethylacetylphosphite is heated, it is first isomerized to the diethyl ester of acetophosphinic acid, which then reacts further with diethylacetylphosphite, leading to the formation of the acetate. TITLE:

Device for the Thermal Analysis (Ustanovka dlya
termicheskogo analiza)

PERIODICAL:

Zavodskaya Laboratoriya, 1959, Vol 25, Nr 6, pp 748-749 (USSR)

ABSTRACT:

A device for the thermal analysis is described which is distinguished from that by Kurnakov by the fact that both the photographic process and the gauging of the thermocouples are unnecessary. The device requires the application of the electron potentiometer EPP-09 at three points and contains a differential thermocouple, an optical intensifier, the electron potentiometer and a heating arrangement (Fig 1). The differential heating curve in the coordinates "time - difference in temperature between sample and standard sample" and the simple heating curve in the coordinates "time - temperature" are simultaneously plotted within the temperature interval of from 0 to 1600°. The differential thermocouple consists of two platinum-platinum rhodium thermocouples. The optical intensifier contains a mirror galvanometer M21 and the selenium photo cell AFI-20. The schematical drawing of

Card 1/2

Device for the Thermal Analysis

the device shows that resistances KMS-4 and a voltage stabilizer STN-35 are also used. The mode of operation of the device is described and a thermogram of quartz given as example (Fig 2). There are 2 figures.

| TITLE | : | Some Experiments Carried Out for the Purpose of Extracting Germanium from Yugoslav Raw Materials | |
| ORIG. PUB. | : | Tehnika, 13, No 10 (1958); Rud i Metalurg, 9, No 10, 240-240a (1958) | |
| ABSTRACT | : | Germanium has been extracted from copper concentrates containing 0.01% Ge or from flue dust from copper-smelting furnaces containing 0.087% Ge by melting down copper buttons and by volatilizing the sulfides. The high S content made it impossible to obtain satisfactory enrichment of the buttons in germanium. Volatilization of the sulfides at 1,000° in a stream of H ₂ from copper concentrates permitted the achievement of a twenty-fold enrichment of the germanium. Under | |
