TITLE: Optimum dynamic mode of operation of a magnetogasdynamics energy converter

SOURCE: Magnitnaya gidrodinamika, no. 1, 1966, 55-64

TOPIC TAGS: magnetogasdynamics, magnetic energy, electric energy conversion,
magnetic field, electric conductivity, approximation, generator

ABSTRACT: The optimum dynamic mode of operation of a magnetogasdodynamic generator
with constant local electrical efficiency and a constant magnetic field has been
investigated by using one-dimensional equations for the flow of conducting gas in the
converter duct. The valid limits for the one-dimentional approximation of electri-
cal and magnetic quantities were determined. The optimum specifications for a
magnetogasdynamic generator were found. Simple analytical solutions for certain
cases were obtained. The author thanks V. M. Gavriluk for his interest in this
work and valuable discussions. Orig. art. has: 1 figure and 3 basic formulas.

Production of dihydroxyacetone (1, 3-dihydroxy-2-propanone) by
fermentation. Aurel Puskas, Yearbook Inst. Agr. Chem. Technol., CH
Univ. Tech. Sci. Budapest, Hung. 1952 III-1954 VIII, 150-3.

Yeast soln. with 6% glycerol content was fermented with Acetobacter
suboxydans at 30° under aeration. About 90% of the glycerol was
oxidized to 1,3-dihydroxy-2-propanone (I) after 5 days. With
decreasing aeration rate the yield decreased. About 70% of I could
be recrystd.

Preparation of compost for mushrooms. Aurél Puskás
und Anna Szilágyi. Yearbook Inst. Agr. Chem. Technol.,
Univ. Tech. Sci. Budapest, Hung. 1952 III-1954 VIII, 209-
14.—Compost for mushroom growers is prepd. from manure
in a 4-week cycle with $(\text{NH}_4)_2\text{SO}_4$ addn. at the end of each
week. Changes in compost so prepd. were followed up to 30 b
days. Both the pH and NH_3 content are reduced and
about 30% of the org. matter present is decompd., mostly to
cellulose and pentosan. At the same time the protein and
lignin contents increase. Addn. of trace elements had no
effect on the yield. Adding the superphosphate at the end —
of the 3rd- rather than the 2nd-week period increased the
yield 13%. J. A. Szilard

PUSKÁS, A.

Isolation of bacterial strains forming 2,3-butanediol and laboratory fermentation experiments. Aurél Puskás and Gyula Számel. Yearbook Inst. Agr. Chem. Technol., Univ. Tech. Sci. Budapest, Hung. 1952 III-1954 VIII, 144-9. Of 200 strains of *Bacillus polymyxa* (I) obtained from Hungarian soils, 85 were selected for fermentation expts. These were conducted with wheat mash prep'd. from 60 g. wheat farina, 6 g. CaCO₃, 0.5 g. ground malt, and 400 cc. tap water. The mash was heated on a water bath at 70° for 20 min., then autoclaved 1 hr. at 121°, finally inoculated with I and kept for 60 hrs. at 30° with occasional shaking. The EtOH and 2,3-butanediol contents as well as the ease of filtration were detd. The 2,3-butanediol content of the filtered sample varied for 16 strains up to 1 g. per 100 cc., for 28 strains between 1.0 and 1.5 g., for 30 strains 1.5-3.0 g., and for 11 strains over 2 g. The ability to form alcs. and the filterability of the mash with strains, preserved for 8 months by subculturing, deteriorated. Strains preserved under sterile paraffin oil did not change appreciably. Fermentation expts. were conducted with corn and potato mash, too. I. A. Seilard

AUTHORS: Ursu, I., Puskás, F., Cristea, V.

TITLE: Semiconductor properties of the ZnO - Al₂O₃ system

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1963, 71 - 72, abstract 3E498
("Rev. phys. Acad. RPR", 1962, v. 7, no. 2, 277 - 286, English)

TEXT: The electric conductivity of a pelletized ZnO-Al₂O₃ mixture was examined. The relative concentrations of the components were varied between 0 and 100%. The pellets were first annealed for 6 to 8 hours at 1,200°C and subsequently for 12 hours at 900°C. It has been established that the activation energy of the electric conductivity and the temperature coefficient of resistance depend on the ratio of the components and reach a maximum for the mixture 1 : 1. This composition to which corresponds the compound ZnAlO₄ with a spinel-type structure is recommended as a thermistor for use at high temperatures. There are 27 references.

TITLE: Method of burning corundum articles in electrical furnaces

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 3, 1963, 406, abstract
3M85 (Hung. patent 148772, December 31, 1961)

TEXT: The method patented for the production of high-strength ceramic articles is characterized by the fact that they can be heat-treated in electrical furnaces at relatively low temperatures: 1250 - 1450°C. The optimum composition of the mixture is >99.8% pure Al_2O_3 combined with 2 - 5% (4.2%) titanium and manganese or titanium and copper oxides. In the burning process, at least 90% of the crystals are obtained $< 3\mu$ in size. So as to obtain a high degree of hardness, strength and viscosity it is foreseen that Al_2O_3 will be used with a total content of sodium, potassium, vanadium and iron oxides of 0.05% of silicon dioxide < 0.1% and of titanium and manganese dioxide of 0.05%. The high quality of the articles, e. g., wire-drawing rings, thread guides, sandblast units etc.,

✓ 151. Puskas, T., Some lessons drawn from river discharge statistics (in Hungarian), Res. Inst. for Water Resources, Budapest, 1954 Report, 90-99; 1955.

Daily observations and use of a discharge curve give accurate runoff in large rivers; gradually varying bottom does not particularly complicate computations. In small rivers, stage observation once a day is unreliable, as periodical fluctuations are possible. Changes in the bed can cause errors as large as 250%. Influence of nonuniform flow can also be of particular importance in these conditions.

72. Lessons drawn from the Tisza river flood statistics — T. Puskas, *Vízügyi Közlemények* — 1951 No. 2, pp. 157—168, 19 figs.)

The design flood stage of the Tisza river adopted in hydraulic planning, determined as the upper envelope of recorded peak floods with certain corrections, was subjected to a statistical analysis by the probability calculus method for comparison with flood records. The investigation, spread over a period of 65 years (1888—1952), covered the maximum flood flow due to the spring snow runoff each year at nine sections of the river. This paper presents some interesting experiences in preparing the evaluation and the most important results of calculations. Statistical analysis was based on flows corresponding to the aforementioned river stages.

T. P. Liraas

On the very gently sloping Tisza river ($I = 10.000$ to $50,000$), the magnitude of flow at the same stage is substantially influenced by the changes in the slope of the water level. For the determination of discharges this problem had to be investigated in greater detail, moreover, rating curves had to be extrapolated. As a summary of the statistical analysis the longitudinal hydrological section of computed flood flows of different probability, and of the minimum, maximum and mean flood flows recorded during the period investigated as well as the longitudinal section illustrating the change of the coefficient of variation, were elaborated.

"Effect of Antidiuretic Hormone on Cell Membrane Permeability"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol 29,
No 3-4, 8 Jun 1966, pp 219-223.

Abstract: [English article] The purpose of these studies is the investigation of the permeability-increasing action of vasopressin on inulin transport in rats. Any inulin introduced into the organism is supposed to remain in the extracellular compartment. In the tests described, the amount of inulin introduced into rats increased in the kidneys and in the urinary tract if antidiuretic hormone was introduced. Since inulin is not secreted in the kidney, the introduced antidiuretic hormone must have either reduced glomerular filtration or caused a reabsorption of inulin at some point of the nephron or in the renal pelvis, owing to increased permeability. 15 references, including 2 Hungarian, 1 German, and 12 Western. Coverage: This is an elementary handbook on photography for amateur photographers. It gives all the necessary principles of photography as well as practical hints for taking pictures, developing, enlarging and printing. It also outlines most commonly used cameras, lenses, and other photographic equipment. Cameras and lenses of Russian make are shown and some data given. However, essentially they

ABSTRACT: A study has been made of the filterability of T-5 type, high-boiling jet fuels. The experiments were carried out in a special apparatus using an FG-25 aviation filter, briefly described in the source, with pre-filtered fuels with or without 0.3% cellosolve anti-icing additive. The criterion of filterability was the temperature at which a flow rate of 4 kg/sec at a pressure drop of 6 kg/cm ² max across the filter was attained. It was found that filtration difficulties due to viscosity proper arise when viscosity rises to 250—280 cs. Filtration difficulties at lower viscosities are mainly due to the precipitation of ice crystals or high-boiling hydrocarbons. Anomalous viscosity, which is typical of oil fractions and diesel fuels, is also in evidence in T-5 type jet fuels. Cellosolve, an anti-icing additive for T-1 type jet fuels, is also suitable for T-5 fuels. Orig. art. has: [SM] 2 figures and 3 tables. "Renal Function in the Rat During Obstruction of the Ureter."

Budapest, Kisérletes Orvostudomány, Vol XVIII, No 5, Oct 66, pages 531-535.

Abstract: [Authors' Hungarian summary] 1) The extent of GFR was studied in the rat during ureteral obstruction in the presence of various degrees of hydration. 2) It was found that non-hydrated (control) animals had a GFR value of 0.131 ml/min; in physiological salt diuresis, the GFR value was 0.129 ml/min and in water diuresis it was 0.106 ml/min. 3) In osmotic diuresis produced with Mannit, the GFR value in the kidney with obstructed ureter drops to 7-8 per cent of the normal value (0.0237 ml/min). 4) The mechanisms are discussed which may insure glomerular filtration during ureteral obstruction. 5) A simple method is described which is suited for the study of glomerular filtration during ureteral obstruction and the nature of the necessary calculations is also presented. 3 Hungarian, 12 Western references. Pusset, L. A. On a type of auto-oscillations in systems with regulated angular coordinate. Izv. Akad. Nauk SSSR. Otd. Tehn. Nauk 1956, no. 9, 24-30. (Russian) A study of the stability of a system characterized by the equation:

$$I\ddot{\phi} + R\dot{\phi} + K\phi = F \sin(\omega t + \varphi),$$

where I , R , K , F , and ω are constants. Linearizing this equation and expressing its solution as a power series in a parameter, the author obtains a form of Hill's equation whose stability is investigated by a method analogous to that used by Stoker [Nonlinear vibrations in mechanical and electrical systems, Interscience, New York, 1950; MR 11, 666]. Stability regions for this equation are derived and stated in terms of the parameters of the original equation. L. A. Zadah (New York, N.Y.).

PUSSET, L. A.

Sources:

Pusset, L. A. Diffraction of a homogeneous beam. Akad. Nauk SSSR. Zhurnal Ekspert. Teoret. Fiz. 20, 722-728 (1950). (Russian)

The beam is derived from a single spherical wave-function $\psi = (e^{-i\omega t}/R)u(\theta, \varphi)$, where

$$\sin \theta \partial/\partial \theta (\sin \theta u/\partial \theta) + \partial^2 u/\partial \varphi^2 = 0,$$

and lies entirely on one side of a plane through the vertex. The field-vectors are $E = iN_0$, $H = (k/\omega\mu)M_0$, where

$$N_0 = (e^{-i\omega t}/R) \left(0, -\frac{1}{\sin \theta} \frac{\partial u}{\partial \varphi}, -\frac{i}{\sin \theta} \frac{\partial u}{\partial \theta} \right)$$

$$M_0 = (e^{-i\omega t}/R) \left(0, \frac{1}{\sin \theta} \frac{\partial u}{\partial \varphi}, -\frac{\partial u}{\partial \theta} \right)$$

[cf. Stratton, Electromagnetic Theory, McGraw-Hill, New York-London, 1941, pp. 394, 415; the author refers to a Russian translation of this work]. The transformation

$x = \tan(\theta/2) \cos \varphi$, $y = \tan(\theta/2) \sin \varphi$, exhibits u as a harmonic function of x and y . This is used to show that the field is finite everywhere, except at the vertex. It is also

pointed out that the field is transverse. The author then considers boundary problems for the illuminated portion of a sphere, centre at the vertex. By the theory of Neumann's problem, the field-vectors along the boundary of such a portion are more than sufficient to determine the field within. The author suggests, without formal proof, that "generally speaking" the field will be determined by specification of the light intensity and polarisation along the boundary. Finally he associates with such a beam a field which is finite everywhere; this problem derives from optical systems but is not formally posed. He uses formulae due to Kotter which are, with certain discrepancies, (30) and (31) of Stratton [loc. cit., p. 469]. The nature of this field is examined for distances large compared to the wave-length.
