1025. RÁCZ I., PASTINSZKY I. and SÁRMÁNY J. *Adatok a pityriasis rosea keletkezésének pathomechanismusához. The aetiology of pityriasis rosea BORGYÓGY. VENER. SZLE 1956, 32/1 (18-22) Graphs 2 Tables 1 illus. 3

Among patients with pityriasis rosea, approximately 43% of the cases showed increase of temperature, which in a considerable number of cases was accompanied by a decrease of the eosinophil count and a histologically demonstrable increase of the inflammation of the foci of pityriasis rosea. On penicillin therapy, the average duration of treatment was reduced to 13 days. When these phenomena are considered on the analogy of the Jarisch-Herxheimer reaction, this seems to evidence the spirochaetal origin of pityriasis rosea, although these phenomena can also be explained by assuming a mycotic origin. The pathogenesis of pityriasis rosea is, therefore, by no means explained.

2239. RE-TESTING WITH THE NELSON TEST OF HUMAN SERA WHICH HAVE GIVEN DUBIOUSLY POSITIVE OUTCOMES WITH THE INHIBITION TEST OF NEURATH - Módosított Neurath-féle inhibitor-reakcióval verifikált bizonytalan szeropozitív esetek felülvizsgálata Nelson-teszt-tel - Rácz I., Király K. and Károlyi I. Az Országos Bőr-Nemikórtani Intézet; Bőr-Nemibeteg gondozó Int. Közl., Budapest - BORGYOGY. VENER. SZLE 1958, 34/3 (123-126) Tables 2

Sera from 57 patients which had been verified 7-8 yr. previously with the modified Neurath test were re-tested with the TPI test. The results were in agreement in 63.2% of the cases, and there was a discrepancy in 26.3%. Doubtful cases (10.5%) were almost always TPI-positive. A discrepancy with the TPI test was seen in non specific and uncertain cases. The specificity of the inhibition reaction was satisfactory, but its sensitivity was rather low. The discrepancies are explained by considering that the inhibitor inhibits only the reagins of the γ -globulins one-sidedly, while previous treatment may constitute a disturbing element or the reagin titre of the sera may have been fixed too high or too low. Since the introduction of

"Experiences With Epoxy-Resin Sensitization."

Budapest, Orvosi Hetilap, Vol 107, No 32, 7 Aug 66, pages 1509-1513.

Abstract: [Authors' Hungarian summary modified] The data of 54 dermatological patients working with epoxy resins are described. The clinical forms of the skin lesions are discussed. In 46 cases, skin lesions appeared within 6 months of contact with the resin. According to skin application tests, sensitization was due to the resin alone in 23 cases, to the hardener in 1 case and to their joint effect in 8 cases; in 14 cases, the irritating effect of the materials was the cause of dermatitis. Screening tests were also carried out in factories using epoxy resins. Varying degree of damage by the epoxy was found among 20.2 per cent of the workers. The circumstances of the development of dermatitis and sensitization, the problem of spontaneous desensitization and adaptation (hardening) are discussed and it is stressed that the incidence of such damage could be minimized by suitable preventive measures. 5 Hungarian, 23 Western references.

Title : A Chromatographic Study of Galenic Preparations of
Strychnus Seeds.

Orig Pub: Magyar Ken. folyoirat, 1958, 64, No 3, 97-99.

Abstract: The separation and the identification of the most important elements in the extract of Strychni is best carried out on Whatman No. 4 paper impregnated with KH_2PO_4 and by using a mixture of n-butyl alcohol and water in a 1:1 ratio. A rapid method (circular chromatogram) is developed which is also adaptable for the determination of rutin.

69. Substitution of nodular for malleable cast iron.
M. Cech, O. Kacz. *Kohárségi Lapok, Ünlődé*. Vol.
7, 1956, No. 3, pp. 99-102, 8 figs., 2 tabs.

The mechanical properties of malleable and nodular cast iron were compared. Railway brake shoes were employed for the tests. Nodular cast iron containing smaller quantities of Si stands up better to dynamic stress and therefore can often be used as a substitute for malleable castings the production of which is more expensive. However due to the low Si content the casting properties of nodular cast iron are inferior, therefore a melting equipment permitting sufficient overheating is necessary for its production. Another method for improving the casting and shrinking properties of low silica nodular cast iron is increasing its carbon content.

The water glass-carbon dioxide core process in foundries.
Ottó Rácz (Vas- és Acélműtér, Csepel, Hung.). Öntvény-
9, 6-11 (1968).—By using a water glass (I) of 48-52° B $\acute{e}$ sp.
gr. and of 2.5-2.8 hydraulic modulus, the currently used
7% I content can be reduced to 4%. This will result in an
improvement of the residual core strength. For molds,
I should have the same sp. gr. and a modulus of 2.5-3.4 to
facilitate drying. Ambient temp. in the shop must not
fall below 15°. The sand most suitable for mixing with I
should contain 95% finely ground SiO₂ and 5% bentonite.

Abstract: [Authors' Hungarian summary] The authors report 17 transabdominal liver biopsy tests performed on 10 infants and children who suffered from infectious hepatitis. The method, indications for it, and the conditions under which it can be performed, the procedure before, during and after the test, as well as the expected results and possible complications are discussed briefly. It is stated that liver biopsy is not a dangerous procedure for infants and children and can be performed at this age as well. The authors recommend its more frequent use in the future. 2 Hungarian, 6 Western references.

TITLE: Coronary reflexes in the unanesthetized dog [This paper was presented at the 29th Meeting of the Hungarian Physiological Society held in Szeged from 2 to 4 July 1964]

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, Supplement, 1965, 30

TOPIC TAGS: dog, circulatory system, blood pressure, animal physiology, drug effect, EKG, hypoxia

ABSTRACT: Polyethylene cannulas were inserted surgically into the descending aorta and the right atrium, and a nylon thread was passed under the terminal part of the coronary sinus and was led out from the chest through a rigid plastic tube. By pulling on the

Card 1/2

L 14886-66

ACC NR: AT6007412

thread, the sinus could be occluded, the receptors of the coronary sinus reflex and the coronary depressor reflex could be stimulated simultaneously. Two opposite reactions were elicited by this procedure a) hypotension and bradycardia, b) prolonged hypertension and tachycardia. While either type of responses may have developed in the same animal, one of them usually predominated. The reactions were not accompanied by ECG changes indicative of myocardial hypoxia or dysrhythmia. Following pericardial injection of procaine, both reactions ceased. A small dose of an anesthetic agent extinguished only the pressor response. It is assumed that the prevailing state of the pressor and depressor equilibrium significantly modifies the character of the coronary reflexes. [JPRS]
