TITLE The Phenomenological Consideration of the Influence of a Nonconducting Medium in Quantum Electrodynamics.
(Fenomenologicheskiv uchët vliyaniya neprovodyashchey sredy v kvantovoy elektrodinamike - Russian)

PERIODICAL Zhurnal Eksperim.i Teoret.Fiziki, 1957, Vol 32, Nr 5, pp 1244-1246(USSR)

ABSTRACT First of all the paper under review refers to some relevant preliminary papers; they direct attention to the structure of a covariant Feynman-Dyson's perturbation theory for the phenomenological Quantum electrodynamics in a medium. In this context, it will be of advantage to use the formulation proposed by Tamm for the phenomenological electrodynamics, in which the properties of the medium are described by the tensor $\epsilon_{\lambda\rho\sigma}$ of the dielectrical and of the magnetic permeability. This tensor connects the tensor of the fields F_{λ} with the tensor of the inductions: $H_{\nu\lambda} = \epsilon_{\lambda\rho\sigma} \cdot F_{\rho\sigma}$ is then specialized for a homogeneous isotropic medium, and an equation is derived for the potential of the electromagnetic field. It is also easily possible to derive the rules for the computation of the elements of the scattering matrix. For the Green's function of the photons, a formula is given in the impulse space. In order to obtain convergent expressions, it is necessary to limit in an invariant way the impulse domain of the side of the soft quanta. An additional term, the constant λ^2 is introduced into the denominator of the Green's function: it cuts off the infrared domain. Then the paper under review gives

Card 1/2

The Phenomenological Consideration of the Influence of a Nonconducting Medium in Quantum Electrodynamics. 56-5-43/55

the final expression for the Green's function. The matrix elements can be computed with the aid of the usual technique of graphs. Expressions are also given for the probability of the emission of an unpolarized proton by an unpolarized electron, and for the energy emitted per unit of time.

TITLE: Change in probability of fast meson decay caused by Coulomb scattering in dense media

PERIODICAL: Referativnyy zhurnal. Fizika, no. 6, 1961, 77, abstract 6B249 ("Tr. Mezhdunar. konferentsii po kosmich. lucham, 1959, v. 2", Moscow, AN SSSR, 1960, 347 - 348)

TEXT: Decay probability of a fast μ -meson is calculated with allowance for the interaction of the μ -meson and decay electron with the summary external potential of the atoms of an amorphous medium. The expression obtained for transition probability is averaged over all possible distributions of the medium atoms and is dependent only on the nuclear charge and medium density. If the decaying particle is at rest relative to the medium, Coulomb scattering of the final particle alone takes place, and the corrections considered vanish in the averaging process. Interference of the Coulomb scattering of the fast decaying particle and

decay products reduces the total decay probability, i.e. increases the life time of the particle. In its properties and nature, the effect considered is an analog of the Landau-Pomeranchuk effect for brehmsstrahlung.

TITLE: Method of testing sheet materials for biaxial extension at a different reserve of elastic energy

PERIODICAL: Zavodskaya laboratoriya, v. 29, no. 5, 1963, 600-604

TEXT: Analysis of a number of operational failures such as the explosion of the British "Comet" jet aircraft has shown that with a rise in the reserve of elastic energy in the presence of defects not only acceleration of deformation and failure occur, but also a reduction in the strength of a material can be expected. A device has been constructed to test biaxial extension of sheet material at a different reserve of elastic energy by means of pneumatic (gaseous nitrogen) or hydraulic (liquid AMG-10), arranged so that the working part of the test piece was in a zone of practically symmetrical biaxial extension. In tests of the influence of the working medium transmitting pressure to the test piece on the strength and nature of failure of the sample, test pieces were broken down into rather large pieces in the hydraulic test and into fine pieces in the pneumatic. In tests of the influence of the volume of the working medium it was found that increase in the volume of the container did not lead to substantial change in the kinetics, although the rate of deformation increased. There are 6 figures Card 1/1 ja/llh \ and 2 tables.

TITLE:

Resonance-vibrator for the Production of Cracks in Samples
(Rezonansnyy vibrator dlya sozdaniya treshchin v obraztsakh)

PERIODICAL:

Zavodskaya Laboratoriya, 1959, Vol 25, Nr 3, pp 341-343 (USSR)

ABSTRACT:

Methods of testing cracked samples have already been reported on (Ref 1). Since the methods of producing cracks in samples used so far take up too much time, a resonance-vibrator unit for producing cracks was constructed (Figs 1,2). The vibrator (according to TsAGI), which can be freely shifted along the tube, is fastened to the tube at the support. Vibration speed of the vibrator disk: 1500 rpm, length of the tube: 400 mm, weight of the vibrator with support: 1 kg, outer diameter of the tube: 45 mm, inner diameter: 35 mm. With an amplitude of 5-6 mm cracks can be produced within 3-4 minutes. Investigations of the influence of the load frequency which were carried out by periodical impact tests on cracked samples on the one hand (150 impacts/min) and on the vibrator on the other hand (frequency: 900 periods/min), showed no difference for medium-resistant steel 30KhGSA and highly-resistant steel 30KhGSNA.

Card 1/2

SOV/32-25-3-32/62

Resonance-vibrator for the Production of Cracks in Samples

Cracked samples of the same material with the dimensions 10 x 8 mm and 5 x 4 mm were tested and a comparison of the results showed that both tests give the same classification and, for the most part, give absolute values of the specific work similar to those obtained in impact bending tests. There are 2 figures and 1 Soviet reference.

TITLE:

Extension Test at Various Elastic Energy Reserves (Ispytaniye na rastyazheniye pri razlichnykh zapasakh uprugoy energii)

PERIODICAL:

Zavodskaya Laboratoriya, 1959, Vol 25, Nr 1, pp 76-82 (USSR)

ABSTRACT:

The test plant DRP-361 was designed for studying the influence exercised by the initial elastic energy reserve upon load conditions and material properties. It is provided with a dynamometric spring with variable elasticity. The maximum load and maximum reserve of elastic energy which is stored up in the spring dynamometer, depend on the properties of the chosen spring, their number and arrangement. By means of that plant, short and long-term tests of extension can be carried out according to the scheme of an isolated and unisolated system. The mechanical and hydraulic part of the plant is calculated for a maximum axial load of 15 tons, a maximum oil pressure of 100 kg/cm², and a maximum piston motion of 15 mm. The plant covers the test plant (Fig 1), a system of hydraulic supply lines (Fig 2) and a set of measuring

Card 1/2

Extension Test at Various Elastic Energy Reserves

SOV/32-25-1-31/51

instruments. The set is provided with a loop oscillograph MPO-2, the dynamometric spring represents a series of foil springs (according to GOST 3057-54), and AMG-10 was used as working liquid. The cells were calibrated (for the purpose of measuring the axial load of the specimen) by means of the IM4A test plant. The oscillograms obtained were measured by means of a BMI microscope. The sample stress was measured by means of tension indicators. The latter consist of the ICh indicator, a small elastic U beam of beryllium bronze and "resistance cells" of the DK-10 or DK-25 type. It was stated that the influence of elasticity is determined by the kinetics of the change in the load force. Some further observations were made with the D16T alloy and some 30 KhGSNA steel specimens. There are 9 figures, 3 tables, and 9 references, 6 of which are Soviet.

AUTHOR: Ryazanov, S., Assistant Chief of Political Department of
the Volga Territorial Administration of GVF

TITLE: In a Fight for Higher Crops (V bor'be za vysokkiye urozhai)

PERIODICAL: Grazhdanskaya Aviatsiya, 1957, Nr 8, p. 5 (USSR)

ABSTRACT: The crews of plane commanders Klimov, Deryugin, Filichev and others, and some individuals, are commended for their work in helping Soviet agriculture to obtain better and larger crop yields, and for their readiness to use and spread advanced methods, especially as far as economy of fuel is concerned. The article praises the unit whose commander is comrad Ognev more than the others and emphasizes the assistance his unit received from comrade Ponomarev, the local (i.e. Volga territorial administration) party secretary. To achieve better co-operation Comrade Klimov and his crew informed in advance the sovkhoses about all necessary preparatory work the sovkhoses should do in order to facilitate the operations of the aviation

Card 1/2

In a Fight for Higher Crops (Cont.)

84-8-5/36

personnel: stock fuel bins, have loaders ready, etc. The chiefs of kolkhozes were supplied with the schedules of coming operations. The results were good. Comrade Klimov's crew sprayed fertilizers over an area of 3,540 hectares; the quota was fulfilled by 118 per cent. Comrade Deryugin's crew covered 3,124 hectares and fulfilled the plan by 110.6 per cent. Pilot Zaylyalov compiled 6 bulletins informing the participants of the operations about the progress of Socialist emulation among the crews. A photo accompanies the article showing a plane. Caption reads: the An-2 plane during air chemical operations.

TITLE: Glue for mineral-ceramic tool bits

PERIODICAL: Mashinostroitel', no. 1, 1963, 35

TEXT: On the recommendation of the Metal Cutting Section of the Khar'kovskiy politekhnicheskiy institut im. V. I. Lenin (Khar'kov Polytechnic Institute im. V. I. Lenin) the Zaporozhskiy instrumental'nyy zavod im. Voykova (Zaporozhye Tool Plant im. Voykov) has developed a glue and a gluing method for joining mineral-ceramic tool bits by a high-strength glue on the base of the ЭД-5 (ED-5) and ЭД-6 (ED-6) epoxy resin. This glue is composed of epoxy resin, a solidifying agent, plasticizer and filler. Maleic anhydride is used as solidifying agent, while dibutylphthalate is used as plasticizer and zinc oxide as filler. A brief description is given of the glue production process. The tools with the bits glued on are heated to 180 - 220 °C for up to 2 hours, during which time the glue is fully polymerized. The prepared glue can be stored for 3 - 4 days without losing its efficiency. Tests showed that the joints glued with this glue are of high strength. ✓✓

A Two-Year School of Economics (Dvukhgodichnaya shkola ekonomicheskikh znaniy)

PERIODICAL:

Grazhdanskaya aviatsiya, 1957, Nr 11, pp. 7-8 (USSR)

ABSTRACT:

The article relates the experience gained in the two-year school of economics organized in the squadron whose chief is comrade Brosalin. By "economics" the article means knowledge of oblast's resources and possibilities, as well as of capacities of aviation units and experience gained by them. During these two years a series of lectures were delivered on fuel economy, geographical data pertinent to the range of operations, etc. The courses were supervised by comrade Oparin, chief of staff of the squadron, and comrade Trofimov, deputy chief for political affairs. When the school was organized, 32 members of the

...ear School of Economics (Cont.)

84-11-9/36

squadron registered for the courses. As a result, the overall production and economy indices went up, or, in other words, the planes were used more efficiently. This was especially true of the An-2. In 1957 as compared with the first quarter of 1956, the productivity of the An-2 per 1 flight-hour increased by 17/ton kilometers, and hours flown per 1 inventory An-2 increased by 64 hours. Comrade Lis, one of the students, is mentioned by name.

TITLE: The Maturing Engineer (Rastushchiy inzhener)

PERIODICAL: Grazhdanskaya Aviatsiya, 1957, Nr 5, p. 17 (USSR)

ABSTRACT: Vladimir Kurasov graduated from the school for aircraft mechanics and was soon awarded with the "Pochetnaya Gramota" of the TsK VLKSM. He has been employed by the Kiyev Institute of the GVF as an engineer of a training unit to instruct future pilots and mechanics, supervising studies on theory and construction of engines. Among his pupils were, among others, pilots Antonov and Rakitin and mechanics Yakushev and Dimayev. Of 23 improvement suggestions made last year in Kurasov's unit, several suggestions were put into practice. Two of them were made by Kurasov himself: by proper timing of the OKPM oil dilution valve Kurasov found the most effective method of diluting oil with gasoline for the An-2 planes; and by improving the adapter sleeve between the heater and the aircraft intake tube he reduced losses and speeded the heating process.

"Review of M. S. Gol'dberg's "Sanitary Protection
of the Air," V. Ryazanov, 1 p

"Gig i San" No 7

Book fills a gap in hygienic literature. Chapters
on air purification are timely. Chapter on
sources of contamination and measures against it
systematizes data on industries which contaminate
the air, and gives methods in controlling such
contamination. There is, however, much unnec-
essary advice directed to the sanitation doctor.
Book needs revision.

2130. RYAZANOV V. A. Central Inst. of Postgrad. Educ. of Phys., Min. of Health of the USSR, Moscow. *The problem of hygienic standardization of sanitary control of atmospheric air.* Russian text: Tezisy dokladov XIII vsesoyuznom s'ezda gigenistov, epidemiologov, mikrobiologov i infektionistov (Moscow) 1956. Kniga 1 (24—26)

The hygienists should carefully evaluate such factors as adaptation, condition of defence mechanisms, subsensory reactions, and the properties of the air contaminant. Soviet hygienists have elaborated in recent years the admissible concentrations of some 17 air contaminants (dust, soot, manganese, lead, arsenic, phosphorus anhydride, fluorides, nitrogen oxides, carbon monoxide, mercury, sulphur dioxide, aerosol of sulphuric acid, chlorine, hydrogen sulphide, carbon disulphide, phenol and benzene). At present work is being carried out on 5 other substances (hydrogen chloride, acrolein, formaldehyde, dichlorethane, petrol). A programme of further research in this field is presented.

✓ 5892. PERMISSIBLE LIMITS FOR CONCENTRATIONS OF ATMOSPHERIC POLLUTANTS.
(PREDEL'NO DOPUSTIMYE KONTSENTRATSII ATMOSFERNYKH ZAGRYAZNENII). ISSUE 7.
Ryazanov, V.A. (Ed.) (Moscow: Nedgiz, 1957, 169pp., 4s.6d.; title in
Collet's Foreign Bk News, 1957, (10A), 10). On the basis of work done in 1954
and 1955 the following permissible limits, in mg/cu.m, are proposed. These
limits are for a single occasion; the limits for the average concentration
over 24 h are one third of them in all cases. Aerosol of sulphuric acid, 0.30
(no change); sulphur dioxide, 0.30 (previously 0.75); hydrogen sulphide, 0.03
(previously 0.05); hydrogen sulphide with petroleum gas, 0.015 (previously,
0.05); phenol, 0.30 (no change); benzene, 2.4 (no limit previously); and
fluorine compounds, 0.03 (no change). There are separate papers on pollution
by sulphuric acid, sulphur dioxide, hydrogen sulphide and benzene, on pollution
by fluorine as a cause of fluorosis in children, on the method of determining
permissible concentrations, and on new methods of research. The charter and
composition of the Commission for Working Out Permissible Concentrations of
Pollutants are given in full. (BX011/Q).

p. 124, # 5743AUTHOR: Ryazanov, V. P.TITLE: On the Calculation of the Number of Condition Equations in
Restricted Triangulation Networks ✓

PERIODICAL: Tr. Mosk. in-ta inzh. zemleustroystva, 1959, No. 3, pp. 87-90

TEXT: The following formulas are proposed for determination of the number
of condition equations in restricted triangulation networks at all stations of
which (permanent and being determined) angular measurements have been carried
out; for the calculation of the total number S of condition equations

$$S = N - 2k + A' + B' \quad (\text{in adjustment by angles})$$

$$S_d = D - 2k - n + A' + B' \quad (\text{in adjustment by directions});$$

for the calculation of the number of condition equations of shapes f, sides e and
horizon q

$$f = 1 - n + 1, \quad e = p - 2n + 3, \quad q = q'$$

$$S' = f + e + q = N - 2n + 4,$$

Card 1/2

02021

S/035/60/000/C06/038/C38
A001/A001

On the Calculation of the Number of Condition Equations in Restricted Triangulation Networks

$$S'_d = f + c = D - 3n + 4;$$

for the calculation of the condition equations of directional angles a, bases b, and coordinates 0

$$a = u - r + t + A' - 1, \quad b = u - r - t + B' - 1, \quad 0 = 2(r - 1),$$

$$S'' = a + b + 0 = 2(u - 2) + A' + B'.$$

The following designations are adopted in the formulae: n is the number of all stations, k is the number of stations being determined; N is the number of angles measured; D is the number of directions measured; A' are azimuths measured; B' are bases measured; l is the number of lines with two-side observations; P is the number of all lines; q' is the number of stations at which the angles measured close the traverse; u are permanent stations; t is the number of closed permanent transverses. A numerical example is presented. There are 5 references.

TITLE: Results of measurements of lunar radio emissions at wavelengths of 7.93, 11.0, 14.2, and 20.8 cm

SOURCE: IVUZ. Radiofizika, v. 9, no. 5, 1966, 1030-1032

TOPIC TAGS: radio astronomy, parabolic antenna, ^{LUNAR}radio emission, LUNAR ENVIRONMENT

ABSTRACT: The mean effective temperature of the moon was measured in 1964-1965 at Zimenki Station on the 7.93, 11.0, 14.2, and 20.8 cm wavelengths. The basic measuring equipment included a radio telescope antenna 4 m in diameter and two receivers operating on wavelengths of 7.5-15 cm and 15-30 cm. The fluctuation sensitivity threshold of the receiving equipment was from 0.4° to 0.7° at a time constant of 16 sec. The radio emission of the moon was compared with the reference emission of a disk (diameter, 380 cm) coated with absorbing material. The disk was placed in the Fraunhofer region, 230 m from the telescope aperture. The results of measurements of the phase dependence of the moon's effective temperature are shown

Card 1/3

UDC: 523.164.34

ACC NR: AP6033291

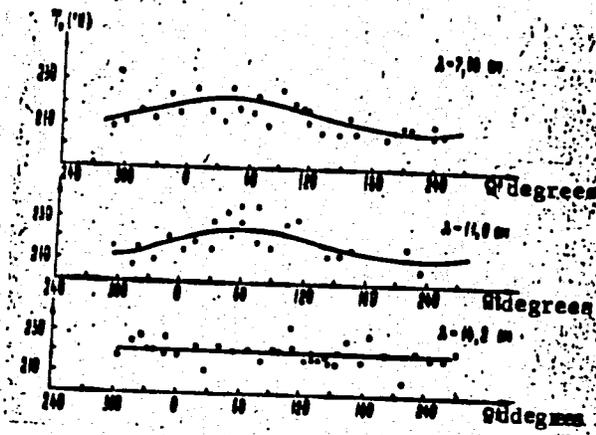

Fig. 1. Phase dependence of the mean effective temperature of the moon

in Fig. 1. A small change in the mean effective temperature as a function of the lunar phase was noted on the 7.93 cm and 11 cm wavelengths. The rms dispersion of the experimental points in regard to the approximated curves is $\pm 3^\circ$. The variable portion of lunar radio emission should theoretically be 3.5—4K for the 14.2-cm wavelength. Since the rms dispersion of experimental points approximately equals this value,

Card 2/3

03004-67

ACC NR: AP6033291

Fig. 1. shows only the value of the constant component of the mean effective temperature which was 221K. Measurements on the 20.8-cm wavelength were conducted during the partial phase cycle. The constant component of the mean effective temperature for this wavelength was 225K. Error did not exceed $\pm 0.5\%$. Orig. art. has: 1 formula, 1 table, and 1 figure.

Ed. (Title page): A.V. Maslov, Doctor of Technical Sciences, Professor;
Ed. (Inside book): A.I. Vitman; Ed. of Publishing House: A.I. Shurygina;
Tech. Ed.: V.V. Romanova.

PURPOSE: This book is intended for geodesists, land surveyors, and agricultural engineers.

COVERAGE: This book is the second of two volumes on problems in surveying and geodesy as related to agriculture. Volume II refers to problems of basic geodetic control for topographic and land use purposes. The first part of the text covers the principles of surveying instruments, telescopes, verniers, and other fundamentals. The body of the text includes complete coverage of the fundamental principles and field procedures in establishing horizontal and vertical control

TITLE: Certain Peculiarities of Moist Mixing and Pelletizing of Lead Charges
(Nekotoryye osobennosti vlazhnogo smeshvaniya i okatyvaniya
svintsovykh shikht)

PERIODICAL: Izv. vyssh. uchebn. zavedeniy. Tsvetn. metallurgiya, 1958, Nr 1,
pp 66-72

ABSTRACT: A presentation of the results of an investigation (carried out on a small scale under shop conditions at the "Elektrotsink" plant) of procedures employed in preparing a lead smelting charge for sintering and involving preliminary moist mixing and pelletizing of the charge in a bowl-shaped granulator 1 m in diameter. The investigation also dealt with the effect of the conditions of granulation of a charge on the efficiency of the sintering operation. It was found that drying of charge is not only unnecessary, but that water in a quantity $>2\%$ must be added during mixing, avoiding, however, an excessively moist charge. Best granulation results were obtained when the charge particles were -6mm in size and the bowl rotated at a speed

Card 1/2

SOV/137-59-1-438

Certain Peculiarities of Moist Mixing and Pelletizing of Lead Charges

of 13 rpm about an axis inclined at an angle of 45° . The strongest granules produced under these conditions ranged from +3.5 to -8 mm in size, which increased the productivity of the sintering machine by 35% and the efficiency of desulfurization in the process by 20%. An increase in the size of granules increases the productivity of the sintering process but impairs the heat-resistant properties of the granules and lowers the degree of desulfurization.
