trotekhn. in-ta, 39, 1959, 56-67) X

TEXT: A thorough theoretical analysis of phenomena and of qualita-
tive relationships is given when a cylindrical sample of a dielec-
tric is inserted into a cavity resonator (the sample diameter is
many times smaller than the resonator wavelength and than the length
of the sample itself, the axis of the sample is directed in the elec-
tric field direction); the purpose of the analysis is to develop a
method of measuring ϵ and losses in the dielectric. The problem
of determining the density of displacement current δ flowing
through the region where the dielectric is inserted is solved to-

gether with the problem of the resonator detuning due to the insertion into it of a sample of material with the unknown ϵ . The accompanying widening of the resonator pass-band is determined as a function of the tangent of the loss angle of the material. A photo-measuring arrangement is given, designed from the principles of the above analysis (wave length ~ 3 cm) and its main measurement characteristics are discussed together with certain details of the method of measurement and calibration.

TITLE: Analytical determination of the coupling factor of a few cascade-connected three-waveguide directional couplers

SOURCE: IVUZ. Radiotekhnika, v. 8, no. 1, 1965, 93-96

TOPIC TAGS: directional coupler, coupling factor, waveguide

ABSTRACT: A method of calculating the coupling characteristics of a directional-coupler cascade suggested by S. M. Finkel'shteyn (IVUZ-Radiotekhnika, 1963, v. 6, no. 1, 64) requires the use of a digital computer. The present article offers another method based on closed formulas (16, 17, 18) for the elements of a general matrix of transfer of a cascade having any number of sections. The new method obviates the use of a computer and preserves a high accuracy for any number of directional couplers. The new method was verified by numerical examples. Orig. art. has: 2 figures and 18 formulas.

AUTHOR: Sablin, Ye. S.

TITLE: Application of the method of mirror images to calculating the dispersion matrix of a slot-type waveguide bridge

SOURCE: IVUZ. Radiotekhnika, v. 8, no. 1, 1965, 111-116

TOPIC TAGS: waveguide, waveguide bridge, slot waveguide bridge 25

ABSTRACT: To determine the parameters of a symmetrical slot bridge, its operation with one-input supply is considered. The waves dispersed into the other three ports are determined by the method of mirror images suggested by Reed and Wheeler ("A Method for Investigation of Symmetrical Circuits with Four Ports"). The input wave is represented as a superposition of in-phase and counter-phase waves simultaneously applied to two opposite ports. Bridge excitation by these partial waves is considered separately, and the resulting amplitudes in the three

Card 1/2

L 56642-65
ACCESSION NR: AP5011961

ports are found from formulas (1) which include the elements of a bridge-dispersion matrix. The bridge is regarded as a quadripole consisting of a cascade of three waveguide sections. The variational problem of dispersion of both waves at section butts is solved, and the matrix elements are determined. The method permits calculating the slot bridge with an allowance for the narrowing step in the bridge center and for the tuning-post admittance. Orig. art. has: 6 figures and 29 formulas.

TITLE: Method of specular images used for calculating the input impedance of a thin probe exciting a rectangular waveguide

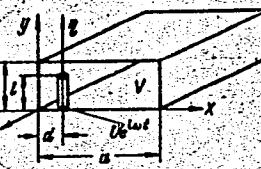

SOURCE: Radiotekhnika, v. 21, no. 2, 1966, 12-21

TOPIC TAGS: waveguide; rectangular waveguide

ABSTRACT: The methods so far suggested for calculating the input impedance of a waveguide-exciting probe (see figure) require very cumbersome formulas and complicated computations (R. E. Collin, "Field Theory of Guided Waves", McGraw, 1960; E. Belohoubek, Arch. der El. Ubertr., v. 9, no. 9, 10, 1955). The present article attempts to develop formulas for calculating the probe reactance which would require minimum computing operations. The reactance is represented by a sum of the probe reactance in free space and a waveguide-caused component which is due to the specular images of the probe in the waveguide walls. The final formulas contain only such series which converge rapidly; this is seen as one of the advantages of the method. Another advantage is the applicability of the formulas to the case of a thin special-shape probe. Orit. art. has: 7 figures and 37 formulas.

TITLE: Relationship between phase shift and the temperature in ferrite phase shifters

SOURCE: IVUZ. Fizika, no. 5, 1966, 51-55

TOPIC TAGS: phase shift, phase shift analysis, phase shifter, ferrite, magnetic permeability, Curie point, dielectric permeability

ABSTRACT: Conventionally prepared Mg-Cu ferrite-chromite specimens were used to verify the assumption that the thermal instability of a ferrite phase shifter is determined by the relationship between the microwave magnetic permeability and temperature. Superimposition of the magnetization curves obtained at various temperatures indicates that the relationship between the phase shift and the temperature is especially pronounced in the range of weak bias fields, and reaches a maximum when the field is zero. An installation was designed to measure the thermal relationship of the phase shift in a vanishing (fade-out) field. The phase shift was measured by comparing the phase of the investigated signal with the phase of the reference signal; the magnetic (μ) and dielectric (ϵ) permeabilities of ferrite were measured by open-circuit current. The

Card 1/2

ACC NR: AP6033836

experimentally determined phase shift caused by a temperature variation in the 25-
-100°C range is 220°C. The dielectric constant goes up slightly with increasing tem-
perature. The magnetic permeability goes up from 0.69 at 29°, to 0.93 at 100°C, and
approaches unity somewhere in the Curie point range. An equation defining the wave
propagation rate in a ferrite specimen in waveguides was constructed. The calculated
phase shift was $\Delta\phi = 212^\circ\text{C}$. The authors thank Engineer G. I. Yudin who made data on
phase shift measurement with relation to the field at various temperatures available.

AUTHORS: Rogachev, A. A.; Sablina, N. I.ORG: Physicotechnical Institute im. A. F. Ioffe AN SSSR, Leningrad
(Fiziko-tehnicheskiy institut AN SSSR)TITLE: Vanishing of impurity levels in germanium at high injection
levels

SOURCE: Fizika tverdogo tela, v. 8, no. 1, 1966, 187-191

TOPIC TAGS: germanium, impurity level, radiative recombination,
semiconductor carrier, pn junction, phonon, conduction band, ioniza-
tion, forbidden band, carrier densityABSTRACT: The authors investigated the radiative recombination of
germanium containing 10^{17} cm^{-3} of arsenic at different injection
levels up 10^{18} cm^{-3} . The injection of the nonequilibrium carriers
was effected by passing short current pulses through the pn junction
in the forward directions. The junctions were prepared by fusing an

2

Card 1/3

L 21157-66

ACC NR: AP6003785

alloy of indium with gallium into n-type germanium. The injection current ranged from 0.1 to 200 a. The pulse duration was from 2 to 10 μ sec. The spectral instrument was a mirror monochromator with LiF prism, and the radiation detector was a cooled lead-sulfide photoresistance. The separation of the phonon radiation from the impurity radiation was by comparison with the spectra of pure germanium obtained at the same temperatures. The concentration of the injected carriers was estimated from the shift of the edge of the phonon-radiation spectrum towards lower energies, for which an empirical relation valid for the range of concentrations from 10^{17} to 5×10^{18} cm^{-3} (at 77K) was obtained. The results indicate that when the injection level is increased the difference between the impurity band and the conduction band decreases, whereas the distance between the valence band and the impurity band remains practically constant. By checking the temperature dependence of the impurity radiation, it is established that the ionization energy ranges between 0.005 and 0.008 ev, and that the decrease in the width of the forbidden band is proportional to the ionization energy. As applied to arsenic and germanium, this means that the levels of the arsenic should vanish at

Card 2/3

L 21157-66
ACC NR: AP6003785

an injected-carrier density of $\sim 1 \times 10^{18} \text{ cm}^{-3}$. This means that the structure of the spectra of radiative recombination ceases to be sensitive to the presence of impurity levels when the injected-carrier concentration approaches this value. The authors thank S. M. Ryvkin for a discussion of the results. Orig. art. has: 3 figures and 4 formulas.

AUTHOR: Rogachev, A. A.; Sablina, N. I.ORG: Physicotechnical Institute im. A. F. Ioffe AN SSSR, Leningrad (Fiziko-tehnicheskiy institut AN SSSR)TITLE: Recombination radiation of strongly doped germaniumSOURCE: Fizika tverdogo tela, v. 8, no. 3, 1966, 866-871

TOPIC TAGS: recombination radiation, germanium, semiconductor impurity, pn junction, semiconductor carrier, optic transition, Coulomb collision

ABSTRACT: The authors investigate the recombination radiation of germanium alloyed with arsenic at concentrations 10^{17} - $4 \times 10^{19} \text{ cm}^{-3}$. The recombination radiation was excited by injection in a p-n junction. The experimental setup used to plot the emission spectra was described in an earlier paper (FTT v. 7, 3339, 1965). The ratio of the densities in the n- and p-regions of the diodes was such that the injection at liquid-nitrogen temperature was possible in all cases only from the p region to the n region, so that only the recombination radiation occurring in the n region of the diodes was investigated in fact. A long-wave radiation, whose intensity decreased rapidly with decreasing energy, was observed. Extrapolation of the long-wave section of the spectrum to zero energy yielded the value of the energy gap, the narrowing of which was determined from the shift of the long-wave edge of the main recombination radiation resulting from the doping. Arguments are advanced in favor of the hypo-

Card 1/2

L 25476-66

ACC NR: AP6009676

5

thesis that the recombination radiation is due to indirect optical transitions occurring as a result of carrier interaction. The influence of the Coulomb collision of the impurities on the energy spectrum of strongly doped semiconductors is discussed. The authors thank L. V. Keldysh and S. M. Ryvkin for useful discussions and advice, V. L. Bonch-Bruyevich and V. Ye. Khartsiyev for interest in the work, and N. A. Belova for supplying the samples. Orig. art. has: 4 figures and 5 formulas.

TITLE: Much Depends on the Attention of the Teacher (Mnogoye zavist
ot vnimaniya rukovoditeley)

PERIODICAL: Vestnik Vysshey Shkoly, 1957, # 10, pp 61 - 63 (USSR)

ABSTRACT: Scientific-pedagogic and methodic circles play an important part in the Novosibirsk Pedagogic Institute. Difficulties in the organization of student scientific work have arisen through the indifference of certain deans and chair heads who did not appreciate this work and appointed unqualified teachers for its control and conduct. In previous years these conditions were much better but have now worsened. In 1956/57, no systematic work was performed by the circles in Soviet literature, Marxism-Leninism and the methodics of the Russian language. There are, however, circles which show a positive activity, e.g. the pedagogic circle under the supervision of dotsent Yu.V. Sharov where actual and complicated problems are dealt with. The scientific circles of the faculties of history and geography also do good work.

All sections and circles of the 300 member-student scientific society devote great interest to pedagogical problems of the educational process and improving methodics. The

Card 1/2

Much Depends on the Attention of the Teacher

3-10-16/30

members of the pedagogic circles together with the chair teachers carried out a series of labor education experiments in Novosibirsk schools and pioneer camps and on the basis of the collected material many interesting articles were composed.

The institute council and the collective of the chairs has emphasized repeatedly the necessity for a further development of these circles and an improvement in students scientific work. But nevertheless, many deficiencies still exist. The author proposes strengthening the scientific supervision of the circles by appointing either a qualified instructor or a supervising collective. The themes of research must be carefully chosen and studied for 2 - 3 years. The author proposes that the best student works be published.

PERIODICAL:

Izvestiya Vsesoyuznogo Geograficheskogo Obshchestva, 1958,
Vol 90, Nr 2, pp 180 - 182 (USSR)

ABSTRACT:

Morphological marks of recent migration were observed in the Chany Lake basin relating to the Bagana and Chulyum River. This phenomena is described in detail and illustrated by a map. Such migrations in the Baraba lowland are supposed to be very frequent. They are caused by the morphological peculiarities of the lowland and characteristic changes in the water supply. Inundation of rivers, the fusion of formerly separate lakes and the increase of their volume means the water supply must come from lakes which previously had no outlets. The total amount of discharges in the country as a whole is also increasing. During this period, migration of watershed-lines and the expansion of lower situated river basins is taking place. There are 2 Soviet references.

Title : An Antioxidant for Fuels Containing Unsaturated
Hydrocarbons

Orig Pub: Neft khoz.-vo, 1954, No 9, 74-77

Abstract: The evaluation of an antioxidant of narrow
fractional composition, "tormoznyy preparat"
("inhibitor") (TP), prepared from wood pitch.
Laboratory research and experiments with the
storage of gasoline have shown that the new anti-
oxidant is markedly more effective than the com-
pound presently used in the stabilization of
gasolines (type B). The induction period in the
oxidation of cracked gasoline stabilized with TP

4730. DETERMINATION OF TETRAETHYL LEAD IN GASOLINE. Shefnina, F.A.
Sabolina, Z.A. and Englin, B.A. (Zavod. Lab. (Fact. Lab., Moscow), 1954, Vol.
29, nos. 672, 673; abstr. in Ref. Zh. Khim. (Ref. J. Chem., Moscow), 1956,
(15), 48116). 50 ml of gasoline are heated with 10 ml of hydrochloric acid
in a boiling water bath with a reflux condenser. The cooled mixture is
transferred to a straining funnel and the deposit on the walls of the reaction
flask is dissolved in 25 to 30 ml nitric acid which is poured into the same
flask. The acid layer is poured into the same flask, the gasoline in the
funnel is washed through with 5 to 10 ml of nitric acid, and the acid solutions
are together evaporated to dryness. Lead is determined colorimetrically or

Fuel
volumetrically. Variations between parallel analyses by the two methods was
not more than 2% and variations from the true concentration of ethyl fluid
averaged 2.5%. The method is more accurate than the soda method and no less
accurate than the bromine method.

Title : The determination of content of wood-resin antioxidant in gasolines by means of a photoelectric colorimeter

Periodical : Neft. Khoz., v. 32, #6, 59-64, Ju 1954

Abstract : The author outlines the use of the photoelectric colorimeter for the determination of wood-resin antioxidant content in different gasolines. This method is based on the light absorbing property of alkaline solutions of wood-resin which is proportional to the concentration of the solution. Calibration of the photoelectric colorimeter with actual concentrations of solution indicates good agreement with the obtained data. Therefore, the authors recommend this method for practical determination of antioxidants in motor gasolines of different origins. 3 charts, 4 tables and 3 Russian references (1936-1953).

fuel 5658. INVESTIGATION OF CHEMICAL STABILITY OF FUELS. Gurev, A. and Bablina, Z. (Nov. Neft. Tekhn. Neftopererab. (News Petro., Tech., Treatment), Moscow), 1956, (5), 3-6; abstr. in Ref. Zh. Khim. (Ref. J. Chem., Moscow), 1956, (18), 59190. The oxidation of fuel by oxygen in air is carried out in 550 ml ampoules. The optimum sample is 40 ml. The filled ampoules are placed in a bath of melting ice for 40 mins, are sealed, and then heated in a

thermostat. After cooling the ampoules to 0°C the amount of absorbed oxygen is determined, and in the oxidized fuel the tar content, the acidity and the peroxide number are estimated. From the above method the effects of various factors on the oxidizability of fuel were determined.

ity and increase duration of storage. It is shown that repeated addition of A to a fuel, 1.5-2 months after its first stabilization with the A, provided that the latter has not been completely consumed, makes it possible fully to restore the initial chemical stability of the fuel. Incorporation of A in two portions produces a greater effect than a two-fold increase of its initial concentration, which is due to greater consumption of A at higher concentration. Under the rigorous conditions of the southern climate zone the duration of storage of gasoline

Mechanism of the catalytic action of metals on the oxidation of fuels containing unsaturated hydrocarbons. A. A. Gurev and Z. A. Sablina (Inst. Combustibles and Lubricating Materials, Moscow). *Zhur. Fiz. Khim.* 30, 2022-3

(1956).—The effects of different sizes of steel and Cu surfaces on the oxidation rate of thermally cracked gasoline was investigated by detg. the amt. of O absorbed and the analysis of the gasoline after the oxidation of 40-ml. samples in 550-ml. sealed ampuls at 100°. The gasoline-oxidation rate was greatly increased by very small amounts of metal. An increase in the size of the metal plate did not increase the oxidation rate. The effect of the metal consists in rapid consumption of the antioxidants present; and the rate of consumption was found to be directly related to the catalytic activity of the metal.

TITLE: Phenols from processing Cheremkhovsk coals as antioxidants
for fuels. (Fenoly pererabotki cheremkhovskikh ugley kak
antioxisliteli dlya topliv).

PERIODICAL: "Khimiya i Tekhnologiya Topliva i Masel" (Chemistry and
Technology of Fuels and Lubricants) 1957, No.6, pp.58-62
(USSR).

ABSTRACT: Oxidation inhibiting properties of phenols obtained during
semicoking of the Cheremkhovsk coals were investigated.
Numerous samples of phenols were tested, but the results for
three most effective samples are given: 1) phenols separated
from spent ammonia liquor, by solvent extraction (the method
is not given) and distilled in vacuo; 2) individual frac-
tions of these phenols (the composition - table 1), and 3)
some phenolic fractions separated from tar (e.g., fraction
boiling 240-330 C). Oxidation inhibiting properties of
phenols were tested by rapid oxidation of samples of various
fuels (containing components obtained by thermal cracking)
inhibited with the antioxidants investigated in comparison
with the same fuels containing already known inhibitors.

Card 1/2

Phenols from processing Cheremkhovsk coals as antioxidants for fuels. (Cont.) 65-6-10/13

Experimental results are given in tables 2-7 and figs. 1-3. It was established that the above samples of phenols are efficient antioxidants for various kinds of fuels containing unsaturated hydrocarbons. They are considerably better than antioxidants made from wood tar and their efficiency is comparable with that of synthetic antioxidants (p-oxydiphenylamine, ionol). The most effective of the samples investigated is the fraction of diphenols isolated from spent ammonia liquor. For practical applications phenols recovered from spent ammonia liquor (ϕ_4 -16) and phenols from tar fraction boiling at 240-330 C (ϕ_4 -4) are recommended.

There are 7 tables and 3 figures.

TITLE: The Non-hydrocarbon Components of Fuel as the Main
Source of High Temperature Deposits

PERIODICAL: Khimiya i tekhnologiya topliv i masel, 1960, No 7,
pp 33-38

TEXT: Ordinary straight distilled fuels containing kerosene-gas-oil fractions are subject to severe deposit formation at temperatures of 120 - 200 °C. There is some doubt about which constituents of the fuel are responsible for this effect and the object of the present work was a direct experimental study of the influence of the non-hydrocarbon components and of the total hydrocarbon part on the thermal stability of aviation fuels. The tests were made on the fuels of which details are given in Table 1 including straight distilled kerosene and kerosene-gas-oil fractions from both low and high sulphur crudes and also catalytically cracked gas oil from low sulphur crude. Tests were made on the hydrocarbon components of these fuels obtained by percolation over activated alumina and also on the hydrocarbon components to which the non-hydrocarbon resinous constituents had

The Non-hydrocarbon components of Fuel as the Main Source of High
Temperature Deposits ✓

been added back in various proportions. The thermal stability was assessed by the rate of blocking of a fuel filter by a deposit when fuel heated to the selected temperature was pumped through it under certain conditions. The results of thermal stability tests on various fuels plotted in Figs 1-3 show that the rate of filter blocking is directly dependent on the content of resinous non-hydrocarbon compounds in the fuel. The hydrocarbon parts of the various fuels were all of high thermal stability but the addition of resinous substances to the extent of 10 mg/100 ml already causes marked deterioration. The addition of resinous compounds to fuels also reduces the minimum temperature of deposit formation. Data on the thermal stability of various fuels and of their hydrocarbon components are given in Table 2. The non-hydrocarbon resinous compounds also have a decisive influence on the thermal stability of fuels containing readily oxidisable unsaturated hydrocarbons, as was found from tests on mixtures of straight distilled fuel with various amounts of thermally cracked kerosene. It will be seen from the data in Fig 4 that even 10% of thermally cracked kerosene

Card 2/3

S/065/60/000/007/001/002
E194/E184

The Non-hydrocarbon Components of Fuel as the Main Source of High Temperature Deposits

seriously impaired the thermal stability of straight distilled fuel but it was shown that this effect was due less to the unsaturated hydrocarbons than to the resinous compounds. Deposit formation is attributed to the poor oxidation stability of the resinous compounds and the tendency of the colloidal oxidation products to coagulate rapidly.

TITLE:

Anti-oxidants for fuels

PERIODICAL:

Referativnyy zhurnal. Khimiya, no. 7, 1962, 546-547,
abstract 7M172 (Sb. "Prisadki k maslам i toplivam". M.,
Gostoptekhizdat, 1961, 388-392)

TEXT: The effectiveness and the mechanism of the action of anti-oxidants intended for automobile gasolines containing components from thermal and catalytic cracking, ethylated aviation gasolines produced by straight distillation, turbojet fuels, tractor kerosenes and diesel fuels were investigated. It was established that the parameters referred to are not determined solely by the structure of the actual inhibitor but depend on the type of the oxidizing hydrocarbons and on the presence in the fuel of non-hydrocarbon additives (e.g. T.E.L.). The most effective anti-oxidant for ethylated aviation gasolines is 0.004-0.005% by weight p-hydroxydi-phenylamine, which ensures that the gasolines will keep without loss of

Card 1/2

Anti-oxidants for fuels

S/061/62/000/007/021/033
B168/B101

conditions for 3-4 years. The most efficient anti-oxidant for stabilizing automobile gasoline A-72 (A-72), which contains +70% components from single-stage catalytic cracking, was found to be FCh-16 (FCh-16) (0.03% by weight); this anti-oxidant consists of phenols extracted from the aqueous fraction of low-temperature carbonization of Cheremkhovo coals and is more effective than wood-tar anti-oxidant, Ionol, or p-hydroxydiphenylamine. Being a surface-active substance, FCh-16 improves the anti-wear properties of fuels. An addition of 0.05% by weight FCh-16 stabilizes for 8 1/2 years those fuels which contain unsaturated hydrocarbons. The addition of anti-oxidants to fuels ensures the retention of their thermal stability at its initial level during storage. 11 references. [Abstracter's note: Complete translation.]

AUTHORS: Rozhkov, I.V., Churshukov, Ye.S., Englin, B.A.,
Sablina, Z.A.TITLE: An accelerated method of assessing the corrosivity of
fuels

PERIODICAL: Khimiya i tekhnologiya topliv i masel, no.2, 1962, 60-64

TEXT: At present the corrosivity of fuels is assessed by a copper strip corrosion test of 3 hours at 50°C (^AGOST 632-52 (GOST 632-52)). This method reveals corrosive sulphur but not other products that may cause corrosion in practice. Corrosion test methods are briefly reviewed and it was decided to develop a new one in which water droplets are precipitated from the fuel on to the test piece. The test is carried out in a water-jacketted conical flask. The specimen, immersed in the fuel to be tested, rests on a water cooled platform. A small container of water is suspended in the air space above the fuel. When volatile fuel is tested a condenser is fitted above the flask. The test duration is four hours with a water jacket temperature of 90°C and the table for the test piece cooled by tap water. About 70 ml of fuel are required for the

Card 1/2

An accelerated method ...

33447
S/065/62/000/002/004/004
E194/E484

test. The test piece is 20 mm diameter; it is cleaned with emery cloth and washed in petroleum spirit. Water, whether dissolved in the fuel or evaporated from the container in the air space, condenses on the test piece. After the test the test piece is washed in an alcohol-gasoline mixture and if a ferrous test piece is used the corrosion products are first removed with hydrochloric acid etching solution. The loss of weight is then measured. The maximum error of repeatability is $\pm 13\%$ and the average about $\pm 8\%$. A number of test results obtained with the new method are given. It is shown that the corrosivity of diesel fuel depends on the mercaptan content. The hydrocarbon composition can also affect the corrosivity and in particular the presence of products of thermal cracking greatly increases the corrosivity. The method can also be used to assess the influence of corrosion inhibitors such as the additive AMBA (AMBA) which has been proposed for testing tanks both aboard ship and on land and it is shown that the use of 0.01% of this inhibitor gives satisfactory protection of ferrous metals against corrosive fuels. I.A.Rubinshteyn is mentioned for his contribution in the tests. There are 4 figures, 2 tables and 8 Soviet-bloc references.

AUTHOR: Rosiek, Olgierd, Sabliński, Jan and Czerski, Przemysław

TITLE: Comparative studies on methods for the identification of bone marrow cells transplanted into animals with acute radiation sickness

PERIODICAL: Postęp higieny i medycyny doświadczalnej, v. 16, no. 1, 1962, 23-36

TEXT: One group of white mice (178) and 2 groups of rabbits (38 and 26) were given total body X-ray irradiation of 800 r and 1100 r respectively. 24 hours later the irradiated mice were intravenously given a suspension of $15-25 \times 10^6$ bone marrow cells of normal rats; the rabbits were injected with $10-16 \times 10^9$ bone marrow cells of either normal female rabbits (exp. 2) or of rabbits that were carriers of Pelger-Huet anomaly (exp. 3). The repopulation of the lymphatic system of white mice by rat cells may be detected by a histochemical test for phosphatase, since rat granulocytes are phosphatase positive while mice cells are phosphatase negative. In rabbits, donor female cells may be detected in male recipients by the presence of sex chromatin. Males have only 3-6% of cells with sex chromatin while in females the percentage is 15-24. In exp. 3, the donor cells that came from rabbits with Pelger-Huet anomaly could be identified by the possession of hypersegmented nuclei and specific structure of chromatin. Stained blood samples of irradiated and treated animals were observed at daily intervals after injection of the donor cells. In mice surviving for more than 16 days following treatment with rat cells "a gradual increase in the percentage of donor cells was observed. In

rabbits (exp. 2) the sex chromatin method gave equivocal results, mainly because of difficulties in identification. Clear evidence of repopulation of the lymphatic system of irradiated rabbits by donor cells was obtained in animals injected with Pelger-Huet cells: The ratio of recipient : donor granulocytes in 2 rabbits was 16 : 56 and 18 : 72, and the ratio of recipient : donor megakaryocytes was 6 : 31 and 9 : 19 (30 days after injection).

In pulmonary tb electrophoresis corresponds to the changes found by means of clinical, roentgenological or other simpler laboratory methods. Therefore it is of no practical value in pulmonary tb, except in some mentioned cases. Extreme shortening of Weltmann's band arouses suspicion of a neoplasm, so that this test has a certain value in the differential diagnosis between pulmonary tb and malignant tumours. Routine use of the cadmium reaction as an addition to the obligatory sedimentation test in phthisiology is advisable.
