ABSTRACT: The Limenda Shipyard has begun to use polyethylene piping in the building and repair of ships. Questions concerned with designing the joints for polyethylene piping, laying out the systems for the material of which the individual sections of piping are made, securing the fittings and piping in place, and normalization of system units, have been resolved. PVP-10x15, 6x25, 6x40, and 6x50 pipe has been accepted for the drain suction and water supply systems. Metal fittings are used. Piping is run more than 300 mm away from steam systems. Piping connected with overboard fittings and located below the floor ceiling remain steel. The technology used in working with polyethylene piping is described. Installation takes place after the installation of machinery, bulkhead spool pieces, and final welding

✓ Influence of fluorine salts on tricalcium aluminate at high temperatures. N. A. TOROPOV, B. V. VOLKONSKI¹, AND V. I. SADKOY. *Tsement*, 21 [4] 12-13 (1955).—Roentgen-ionization analysis was used to determine the effect of 5% K, Na, and Ca fluoride on tricalcium aluminate at temperatures up to 1500°C. Sodium and K fluorides begin to exert their influence and cause decomposition of tricalcium aluminate at 800° into pentacalcium aluminate and free CaO. Above 1300°, the influence of these salts ceases. The action of CaF₂ is similar to that of NaF and KF, but tricalcium aluminate decomposes at $t \approx 1000^\circ$.

Orig Pub : Tr. Gos. Vses. in-ta po projektir. i nauch.-issled. rabotam v tsement. prom-sti, 1956, vyp. 19, 126-132.

Abstract : It was established radiographically that the interplanar distances in crystal lattices of the most important minerals in refractory bricks change evenly with the temperature. The greatest change of the interplanar distances in the crystal lattice characterizes alumocalcium ferrites and free CaO among the refractory brick minerals.

PERIODICAL: Byul. nauchno-tekhn. inform. Vses. in-t nauchno-issled. i proyektn. rabot ogneuporn. prom-sti, 1958, Nr 5, pp 103-118

ABSTRACT: Description, general view, and layout of an ionization X-ray apparatus (IXA) constructed for X-ray investigation of refractories. The IXA was used for the identification of the following structurally similar crystalline phases: Kaolin and clay, mullite and sillimanite, and zirconium dioxide of cubic and monoclinic varieties. With X-ray diffraction patterns (X) identical for the minerals compared, significant differences in the intensity of the lines and the values for the interplane distances were found. The phase composition of corundum-mullite mixtures was determined quantitatively with the aid of IXA. Compared to the conventional Debye diagrams the precision of the results obtained on the X's photographed with the IXA is the same, while the time needed for the determinations (exposure and

Card 1/2

SOV/137-59-1-44

Ionization X-ray Apparatus for Investigating Refractories

development of X) is appreciably reduced, thus rendering the ionization method less labor-consuming than the Debyc method. Besides, the presence of a Pt furnace within the IXA permits the photographing of X's at temperatures up to 1500°C.

TITLE: Evaluation of mountains and friction on a two-level model for the forecasting of meteorological elements in the Caucasus

SOURCE: Tiflis. Zakavkazskiy nauchno-issledovatel'skiy gidrometeorologicheskiy institut. Trudy, no. 19(25), 1965. Voprosy gidrometeorologii (Problems in hydrometeorology), 3-12

TOPIC TAGS: atmospheric model, Coriolis force, weather forecasting

ABSTRACT: Pressure, temperature, and vertical movements were investigated on the basis of vortex velocity and heat flow. Equations for vortex velocity, heat flow, and statics are derived in an isobaric coordinate system x , y , ξ , and t , assuming conditions in the atmosphere to be quasigeostrophic, quasistatic, and adiabatic. Equations relating ϕ , τ , P , l , $\frac{dl}{dy} = \beta$, R , T , c^2 , g , ϵ , γ_a , and p were solved at $\xi=1$, $\frac{1}{2}$ and 0 and $p=0$, 500 mb, and 1000 mb, where ϕ is the geopotential, τ is the vertical velocity, P is the standard pressure, l is the Coriolis parameter, R is the gas constant, T is the air temperature, $c^2=\alpha RT$ for $\alpha \approx 0.1$, g is the force of gravity, γ_a is the

TITLE: Difference method for the solution of the problem of gas motion through variable cross section tubes

SOURCE: Moscow. Universitet. Vychislitel'nyy tsentr. Sbornik rabot, no. 4, 1965. Chislennyye metody v gazovoy dinamike (Numerical methods in gas dynamics), 232-241

TOPIC TAGS: ideal gas, ideal flow, flow analysis, difference method

ABSTRACT: The papers investigate the flow of an ideal gas within a variable cross section tube whose radius is given by the continuous function $r(x)$ ($0 \leq x \leq x_3$):

$$r(x) = \begin{cases} a & \text{при } 0 \leq x < x_1, \\ r_1(x) & \text{при } x_1 \leq x < x_2, \\ b & \text{при } x_2 \leq x \leq x_3. \end{cases}$$

A piston with mass M and negligible thickness is held fixed at the point $x = x_2$. The pressure of the gas to the left of the piston is larger than on the right.

Card 1/2

L 00725-66

ACCESSION NR: AT5013292

Using equations for unidimensional gas motion the author calculates the motion of the piston due to the pressure difference after the instant $t = 0$ when the piston is released. Computations were carried out on the "Strela" computer of the Vychislitel'nyy tsentr (Computer Center) of the MGU. The time needed for the calculation of a layer 290 points thick is 1 min (layers were fixed by specific chosen mass increments). One of the complete solutions required 40 min of computer time. Gas velocity graphs show a comparison between curves calculated by the method of differences and by the method of characteristics (the former exhibits a fine structure as compared with the latter). Orig. art. has: 19 formulas and 2 figures.

BTITLE: Electric explosion of a mercury jet

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniya, v. 2, no. 10, 1965, 463-466

TOPIC TAGS: mercury, exploding wire

ABSTRACT: In view of the inconvenience involved in replacing electrically exploded wires, the authors investigated the possibility of replacing the wire with a jet of liquid metal, so as to produce repeated electric explosions in a simple manner. The working medium used was mercury, and the mercury jet was made to explode both under atmospheric pressure and in vacuum. The setup (Fig. 1) consisted of a system stimulating a mercury jet ("mercury wire"), electrodes with which to apply voltage from a capacitor to the jet, and measuring apparatus. The mercury jet (1) escaped under pressure from a glass capillary (2) and struck an electrode (3). The diameter of the mercury jet was determined by the capillary (0.15-0.30 mm) and its length was 25 mm. The "mercury wire" was grounded, and neither electrode was connected directly to the ground. Voltage (3-4 kv) was applied to these electrodes from a capacitor (5) rated 18 μ F. The mercury pressure in the capillary was produced by pressing on the lever (6) of a bellows (7). The mercury jet flowed through the capillary to electrode 3.

Card 1/2

L 13187-66
ACC NR: AP6001772

The electric explosion of the jet took place when the gap between the jet and moving electrode 4 broke down. To determine what happens during the electric explosion of the mercury jet--whether it travels broken up into droplets or in the form of a molecular beam--the jet-explosion products were sounded with an electron beam. Oscillograms of the collector current show that explosion of the mercury jet produces a molecular beam which contains no individual droplets. The velocity of the leading front of the molecular mercury beam is 2.5×10^8 cm/sec, and its total duration at a distance 23 cm from the point of explosion is 600 μ sec. The sweep duration was 1.2 msec. Orig. art. has: 2 figures.

AUTHORS: Sadkovskaya, Ye.A., Myasisheva, I.V.

TITLE: Investigating the image orthicon operation under the condition of short-time storage

PERIODICAL: "Tekhnika kino i televideniya", no. 3, 1963, 57 - 61

TEXT: The authors present the results of investigating image orthicon tubes under standard resolution conditions at short-time charge storage effected with the aid of electronic shutters. They mention the two possible methods of short-time charge storage, viz. 1) the method of short-time light-pulses and 2) the method of short-time unlocking of the photocurrent (electronic shutter) in the image transfer section. A detailed description of the investigation method is given and the characteristic features of the tube operation under short-time storage conditions are enumerated. The investigations of the operation of the standard JM201 (LI 201), JM203 (LI 203) and JM 207 (LI 207) image orthicons and of the experimental tubes with antimony-cesium and bismuth silver-cesium photocathodes under short-time storage

conditions showed that the majority of tubes can operate under these conditions, although their basic parameters have to be changed. Thus, the signal magnitude drops by a factor of 2 and more, while the signal-to-noise ratio drops to a factor of $\sqrt{2}$ and more, and the resolving power decreases on the average by 100 - 150 lines. There are 2 figures.

Title : Calculation of electron-optical parameters of a beta-spectrometer with double focusing of the electron pencil

Periodical : Izv. AN SSSR, Ser. fiz, 18/2, 215-226, Mar-Apr 1954

Abstract : Data are presented regarding the motion of electrons, source image form, form of receiving slot, intensity distribution in the image and the form of lines, relative semi-width of lines and the applied solid angle, diaphragm form and other electron-optical parameters of a beta-spectrometer with double focusing. In order to determine the trajectory of electrons, it was necessary to determine the field in space through which the electron pencil passes. The field in space was determined by the Maxwell equations. Twenty-seven references: 7 USSR; 15 USA; 4 Dutch and 1 German (1941-1954) Table; graphs; drawing.

TITLE: Aminoalkyl esters of 5-oxy-benzodioxane-1,4			
SOURCE: Zhurnal organicheskoy khimi, v. 1, no. 6, 1965, 1147-1151			
TOPIC TAGS: synthesis, aromatic hydrocarbon, benzodioxane, amino ester, adreno active agent			
ABSTRACT: The present investigation, a continuation of previous work of V. Daukshas, B. Puodzhyunayte, and A. Shvegzhdayte (Nauchn. tr. VUZov Lit. SSR, Khimiya i. khim. tekhnol., 3, 55, 1963) was undertaken with the view of developing new adreno-active agents. The following compounds were synthesized: 5-(γ -alkylaminopropoxy), 5-(α -alkylaminomethyl- β -alkylaminoethoxy)- and 5-(α , γ -dialkylaminopropoxy) benzodioxane-1,4. The physical properties of the above compounds are tabulated. It was found that the compounds possess hypotensive activity. Orig. art. has: 3 tables and 2 equations.

TITLE: Electron paramagnetic resonance. I. Theoretical principles and
apparatus

PERIODICAL: Wiadomosci chemiczne, no. 2, 1963, 91-113

TEXT: In this, first of a series of articles on the electron paramagnetic resonance method and the tool it provides today for theoretical investigations in the sciences and practical applications in industry, the authors deal with the basic phenomena directly associated with resonance effects, the theoretical background of paramagnetic resonance itself, and the experimental methods used to disclose resonance absorption. Under spectroscopy they discuss the fine structure of spectral lines and the spin orbit reaction, nuclear spin and the hyperfine structure, and the splitting of spectral lines in a magnetic field. They explain and derive the formulas for the theory of paramagnetic resonance, and describe

AUTHOR: Kalinowski, Marek Krzysztof, Magister, Senior Assistantand Sadlej, Andrzej JerzyTITLE: Electron paramagnetic resonance. II. Chemical applications
of EPR spectroscopy. Experimental techniques and interpretation of resultsPERIODICAL: Wiadomosci chemiczne, no. 3, 1963, 171-194

TEXT: Second of a series of two review articles in which the authors discuss the applications of EPR spectroscopy. They dwell in particular on the electron spin resonance spectra of free radicals, which depend on the number of atoms with a nuclear spin other than zero and on the spin density of the position of the unpaired electron in the atom, and explain the conditions determining the formation of the hyperfine structure by describing studies on mono- and polycrystals of DEPH and other free radicals, referring the reader to Engram's monograph on the subject.

Sadłowski J., Arch Eng. "Some Remarks on the Construction of the Group of Flats of Madaliński Street in Warsaw".
(Troche uwag o budowie kolonii mieszkaniowej przy ul. Madalińskiego w Warszawie). Przeblad Budowlany. No 1-2, 1949, pp. 18-24, 4 figs. 1 tab

The author begins by discussing the programme and constructional assumptions of the residential colony, after which he passes to an analysis from an economical point of view of the plans of the flats in relation to the staircases. His considerations are based on the relation of "passive" surface (walls and staircases) to the total surface area of the building, and some actual practical data are quoted and criticized. In conclusion, the author advises the preparation of detailed comparative calculations. The article gives new views on the economical layout of flats in residential settlements.

AUTHOR:

Sadłowski, Marian, Master of Engineering

TITLE:

Recent Changes in the Standardization of Steel Grades

PERIODICAL:

Wiadomosci Hutnicze, 1959, Nr 4, pp 110-113 (Poland)

ABSTRACT:

Since the applied steel standards established in 1952 and 1953 proved to be too extensive and incomplete, the Institute of Iron Metallurgy at Gliwice suggested canceling several standards of steels in practice not produced, and replacing these by new ones. For the standards RN-57/MH/JM-55 "Structural-Steel for Savings in Casting" (Table 1) new qualities have been established; from a list of 121, 62 types of casting steel in the range of the standard PN/H-84029 and PN/H-84030 were cancelled. First the following improvements on steel standards were worked out:
a) PN-58/H-84029 "Casting and Structural Steel for Carburization" (Table 2);
b) PN-58/H-84030 "Casting and Structural Steel for Improvement of Heat Resistance", 26 types of steel.
Chemical structure, refer to table 3.

Card 1/3

POL/43-59-4-2/23

Recent Changes in the Standardization of Steel Grades

- c) PN-58/H-84034 "Casting and Structural Steel"
- d) PN-58/H-84035 "Casting and Structural Steel for Carburization - Applied in Airplane Construction"
(16 types of steel).

For carbon tool steels the new standard PN-58/H-84023 has been established. (Previously PN-57/H-85020). This standard contains steels for engineering construction, for rivets, chains, nuts, steel plates for boilers, wires, soft magnetic steel plates, railroads, pipes, shipbuilding as well as steels with a higher brass contents, wires for weaving mills, mining etc. The newly established standard PN-59/H-84019 was worked out as based on the Council of Mutual Economic Assistance (RWPG) (COMECON) held in November 1958, at Bucharest. Table 4 shows the pressure and elasticity property of steels type I and III, table 5 gives the chemical structure of steel types II and III. The minimum requirements for the structure of carbon-steel

of higher quality in the Soviet bloc countries was established according to table 6 together with the requirements for steel types 15G, 20G, 45G, 50G, 60G, 65G and 70G. There are 6 tables.
