AUTHORS: Savoyskiy, E.K., Al'tshuler, S.A. and Kozyrov, B.M.

TITLE: Paramagnetic Resonance (Paramagnitnyy rezonans)

PERIODICAL: Izvestiya Akademii Nauk, Vol. XX, #11, pp 1199-1206
1956, USSR, Seriya fizicheskaya

ABSTRACT: The authors describe the history of discovery of paramagnetic resonance and the subsequent progress of its study in the USSR. The phenomenon of paramagnetic resonance was discovered by Savoyskiy (1) in 1944. The experimental and theoretical study of this phenomenon has been developed along three main directions:

a. Determination of paramagnetic resonance spectra in various substances, in which connection Savoyskiy (15) discovered the existence of weak lines corresponding to $\Delta M > 1$ transitions, where M is the magnetic quantum number of the electronic spin. The hyperfine structure of paramagnetic resonance lines has been extensively investigated by many scientists.

Card 1/4

TITLE:

Paramagnetic Resonance (Paramagnitnyy rezonans)

Al'tshuler et al. (22) found the effect of the atomic nucleus spin on the shape of the paramagnetic resonance spectrum. Zaripov (26) developed the theory of hyperfine structure on singular electronic levels. Salikhov (27) discovered the phenomenon also in free organic radicals. Some of the organic substances were found to possess a "hidden" paramagnetism. Paramagnetic dispersion in the resonance region was investigated for the first time by Zavoyskiy (32).

b. Determination of the shape of paramagnetic resonance lines:

The first theoretical interpretation of experiments on the shape of the lines was advanced by Frenkel' (36). A generalization of the theory was carried out by Al'tshuler (43), while Shaposhnikov (45) devised a phenomenological theory of the problem of the width of lines.

Card 2/4

TITLE: Paramagnetic Resonance (Paramagnitnyy rezonans)

c. Determination of the magnitude of spin-lattice interaction:

Shaposhnikov (53) advanced a general thermodynamical theory, including spin-spin relaxation. His formulae were excellently confirmed by experiments. Al'tshuler (57) generalized on Waller's theory of spin-lattice relaxation in the case of arbitrary spin. Neprimerov (61) measured the rotation of the polarization plane of cm waves under the effect of a constant magnetic field. His results showed that there exists a close connection between the Faraday phenomenon in paramagnetics and the dispersion of susceptibility in the resonance region. Al'tshuler (62) developed a theory of resonance absorption of ultra-sound in paramagnetics. Al'tshuler's computations showed that both electronic and nuclear acoustic paramagnetic resonances can in some cases be observed experimentally.

Use of the Carbometer for the Rapid Determination of Carbon during the Production of O.H. Steel / V. G. F. Chub, I. N. Treigur, A. P. Savranskaya and G. A. Babich. (Zavodskaya Laboratoriya, 1966, No. 8), 391-397. (In Russian). A method of carbon determination sufficiently rapid for following the course of the O.H. process is described. It is based on the use of a magnetic permeability instrument (carbometer) requiring samples in the form of rods 120 mm long and 12.90 ± 0.01 mm. in diameter. The cast sample is first dealt with by the instrument, crushed and examined for pores and slag inclusions. If these are at a sufficiently low concentration the result is accepted and manganese is determined steoscopically, the whole procedure taking 2-3 min. The results are radioed to the O.H. shop.

TITLE: Determining the Reducibility of the Sinter at the Zaporozhstal' Plant (Opredeleniye vosstanovimosti aglomerate na zavode "Zaporozhstal'")

PERIODICAL: Byul. nauchno-tekhn. inform. Ukr. n. -i. in-t metallov, 1957, Nr 2, pp 84-89

ABSTRACT: Improvement in the methods of determining the reducibility of the sinter makes it possible to run 20-24 analyses per day instead of 5. The sinter sample taken is 200 g in the 8-10 mm fraction at $800 \pm 5^{\circ}\text{C}$. The gas flow is continued for 1 hour 25 min, and the rate of gas passage is 3.4 liters/min, the total gas consumption being 290 liters. For better employment of the furnaces, 2 reaction tubes are assigned to each (to permit one tube to be charged while the other is cooling). Their design has been improved: size is reduced by 60 percent, the Fe crucible is replaced by a screen floor, and the method of sealing the reaction tube has been changed (bolted flanges have been replaced by a threaded cover). Three reaction furnaces

Card 1/2

SOV/137-58-7-14063

Determining the Reducibility of the Sinter at the Zaporozhstal' Works

have been installed. Blast-furnace gas may be used instead of producer gas. Blast-furnace gas containing 10% CO₂, 0.5% O₂, and 30.5% CO acquires the following composition after being passed through a 30% caustic or pyrogallol solution: 0.5% CO₂, no O₂, and 32.8% CO.

TITLE: Tin Recovery from Waste Products of Tin Plating
(Iz vlecheniye olova iz otkhodov luzheniya zhesti)

PERIODICAL: Stal', 1958, № 10, pp 957-959 (USSR)

ABSTRACT: During hot tinning of white tinplate, only 80% of tin is actually consumed for tinning; the remaining 20% is transferred into waste products. A chemical method of recovery of tin from the waste products is proposed. It consists of dissolving waste products in hydrochloric acid and, after dilution with water, tin is precipitated in the form of sponge by zinc. Tin sponge is washed, pressed into briquettes and smelted under flux. Tin recovered in this way is suitable for the manufacture of white tin plate. The solution of zinc and ferrous chlorides, which remains after the separation of tin sponge, is treated with 30% hydrogen peroxide to oxidise ferrous iron to ferric iron, which is then precipitated with 25% ammonia (pH = 2). The precipitated ferric hydroxide is separated either by settling or centrifuging and the

SAVRANSKAYA, S. D.

Tertiary triatomic alcohols of the acetylene series and their transformations. III. Oxidation with potassium permanganate. V. I. Nikitin and S. D. Savranskaya (Inst. Chem. Acad. Sci., Tadzhik. S.S.R.). *Zhur. Obshchei Khim.* 23, 1330-8 (1951); cf. *C.A.* 47, 12240b. It was shown that in reality no tautomeric forms of tertiary acetylenic glycols or other tertiary polyatomic alcs. have any existence. Such alcs. are oxidized by $KMnO_4$ at the triple bond to diketones in the 1st stage, followed by 2-fold oxidation: cleavage between C atoms (one being a carbonyl, the other an alc. C atom) to yield $(CO_2H)_2$, and cleavage of the chain between 2 HO groups (cf. Krstiński and Peresiantseva, *J. Russ. Phys.-Chem. Soc.* 55, 1077 (1920); Dupont, *C.A.* 8, 1879). The following list describes the oxidation products of various polyatomic alcs. $Me_3C(OH)C(CMe)(OH)C(OH)Me$, m. $82-3^\circ$, (20 g.) in 100 ml. H_2O treated slowly with 1134 ml. 3% $KMnO_4$ at room temp. gave, after filtration of the MnO_2 , 3.51 g. unreacted alc., some 0.55 g. Me_2CO , 1.2 g. $Me_2C(OH)Ac$, $AcOH$, and HCO_2H (requiring 0.76 g. $NaOH$ for neutralization), 0.6 g. $(CO_2H)_2$, and 4.7 g. $Me_2C(OH)CO_2H$. Similarly 20 g. $Me_2C(OH)C(CMe)(OH)CMe(OH)Et$ gave 0.8 g. Me_2CO , about 1 g. $MeEtCO$, 1.6 g. $MeEtC(OH)Ac$, $AcOH$, HCO_2H , 0.95 g. $(CO_2H)_2$, and 4.1 g. $Me_2C(OH)CO_2H$. 2,5-Dimethyl-5-(1-hydroxycyclohexyl)-3-pentyne-2,6-diol (20 g.) gave 0.7 g. Me_2CO , 1.4 g. cyclohexanone, about 4 g. acetylcyclohexanol (semicarbazone, m. $194-5^\circ$), $AcOH$, HCO_2H , 3.3 g. $(CO_2H)_2$, and 4.2 g. $Me_2C(OH)CO_2H$. Similarly 20 g. 1,2,4-bis(1-hydroxycyclohexyl)-3-butyne-2-ol gave 1.5 g. cyclohexanone, a small amt. of acetylcyclohexanol, $AcOH$, 1.6 g. $(CO_2H)_2$, 4.6 g. α -hydroxyhexahydrobenzoic acid, and 2.6 g. adipic acid. Oxidation of 8.5 g. 2,6-bis(1-hydroxycyclohexyl)-3-hexyne-2,5-diol gave 2.5 g. unreacted triol, 0.9 g. cyclohexanone, 1.3 g. acetylcyclohexanol, some $AcOH$ and HCO_2H , 0.9 g. $(CO_2H)_2$, and 0.3 g. adipic acid. Oxidation of 6 g. 2-(1-hydroxycyclohexyl)-3-butyne-2-ol gave 1.3 g. unreacted alc., 0.3 g. cyclohexanone, 1 g. acetylcyclohexanol, $AcOH$, HCO_2H , 0.4 g. $(CO_2H)_2$, and a little adipic acid. G. M. Kosolapoff

TITLE: Tertiary Triatomic Acetylenic Alcohols and Their Transformations. XVIII. Oxidation of Acetylenic and Ethylenic Glycerols With Potassium Permanganate

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol 30, Nr 3, pp 764-770 (USSR)

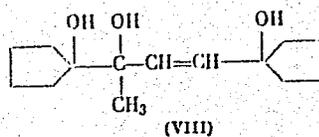

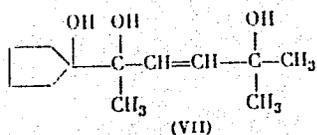

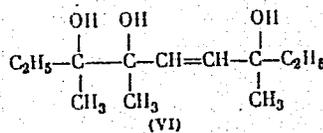

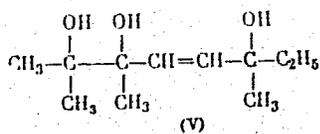

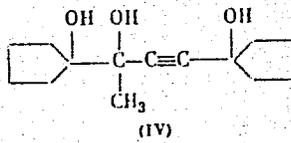

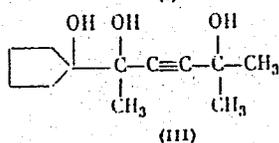

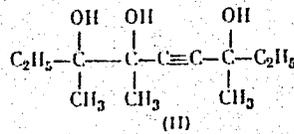

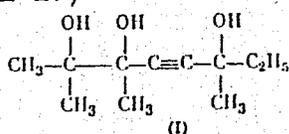

ABSTRACT: The authors reported previously (this journal, 1953, Vol 23, p 1330; *ibid.*, 1956, Vol 26, p 2175) that the oxidation of ethylenic glycerols with $KMnO_4$ involves chiefly the cleavage of single bonds adjoining the multiple bond and that comparatively large amounts of oxalic acid are formed in this reaction. On oxidation of acetylenic glycerols, however, the cleavage occurs at the triple bond and is accompanied chiefly by the formation of hydroxy acids. The above was investigated in detail in the oxidation with $KMnO_4$ of four acetylenic

ABSTRACT: In view of the possible importance of acrylonitrile copolymers in the manufacture of synthetic fibers, the radical polymerization of acrylonitrile in aqueous medium in the presence of ammonium persulfate and furan derivatives such as furfural, furfuryl alcohol and sylvan was investigated and the inhibitory effect of furans on the polymerization process was demonstrated. Furfural was a stronger inhibitor than furfuryl alcohol and sylvan. Similar results were obtained when the radiation-induced polymerization of acrylonitrile was carried out in a nitrogen or air atmosphere in the presence of furan derivatives under the influence of γ -rays from Co-60 (27-45 r/sec.). The experimental conditions and data are given and some of the other factors affecting radiation polymerization are discussed. Orig. art. has: 2 formulas and 2 tables.

TITLE: Copolymerization of acrylonitrile and n-butyl methacrylate under the influence of organomagnesium catalysts

SOURCE: Uzbekskiy khimicheskiy zhurnal, no. 6, 1966, 25-27

TOPIC TAGS: acrylonitrile, copolymerisation, methacrylate, Grignard reagent

ABSTRACT: In order to determine the influence of the nature of the solvent on the properties of an acrylonitrile - n-butyl methacrylate copolymer, the copolymerization was carried out at different temperatures with different monomer ratios in ethyl ether and toluene in the presence of the catalyst n-butylmagnesium bromide (0.4 mole of catalyst per mole of acrylonitrile was used). The specific viscosities of the products showed the presence of low-molecular substances. A decrease in reaction temperature raised the specific viscosity of the copolymer, this being characteristic of an anionic mechanism of polymerization of the monomers. Since the Grignard reagents constitute a complex equilibrium mixture and because of the presence of $(MgX)^+$, $(RMg)^+$ or $(Mg)^{++}$ ions, the initiation of the copolymerization may involve a stage of formation of intermediate complexes; in this case, the nature of the solvent and the conditions of the reaction medium play a considerable part in the initiation process. Orig Pub : Karakulevodstvo i zverovodstvo, 1956, No. 6, 47-48.

Abstract : At the Biysk fur sovkhos a control check of pregnancy of the silver-black foxes (coupled in January and February) is currently practiced. This is effected by means of palpation of the abdominal region 24-26 days after coupling the animals. The method permits to cull barren females and inadequate males and to utilize their pelts.

AUTHOR: Savrasov, D. I.

TITLE: Some information concerning the effectiveness of magnetic prospecting methods in the search for diamond deposits

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 2, 1963, 29, abstract 2D177 (Geologiya i geofizika, 1962, no. 8, 96-103)

TEXT: The author discusses the theoretical grounds of the probability of finding kimberlite pipes by magnetic surveys on various scales. Results are given of laboratory measurements of the magnetic properties of kimberlites in certain regions of western Yakutiya, and of effective magnetization of kimberlite pipes. It is shown that a characteristic peculiarity of anomalies over kimberlite pipes is the approximate coincidence of the contours of the anomaly with the boundaries of the kimberlite pipes. It is therefore possible to identify the anomaly diameters over kimberlite pipes with the

Card 1/2

Some information concerning ...

S/169/63/000/002/110/127
D263/D307

diameters of the pipes themselves. Single weakly magnetic pipes constitute an exception; for these increased magnetic field ($> 30\gamma$) marks out only the central parts of bodies. Another exception are strongly magnetic pipes in which, owing to an unusual distribution of magnetic minerals, the pole of the magnetized body is found considerably below its rim. It is noted that the above method of preliminary assessment of the possibilities of magnetic surveying in searches for anomalies over kimberlite bodies may be used to estimate the probability of discovering any isometric anomalies (for this it is necessary to compute the corresponding nomograms) in dependence on the form of geological objects, e.g. spheres, ellipsoids of revolution, etc. [Abstracter's note: Complete translation.]

PERIODICAL:

Razvedka i okhrana nedr, 1959, ²Nr 2, pp 47-48 (USSR)

ABSTRACT:

The author describes the results of drilling tests made in 1957 with a vibration drilling installation VUL-2, devised by the LENGIPROTRANS. The rig is mounted on a GAZ-63 autobus, has a VPM-1 vibrator and an alternate current generator SG-25/6 with n = 1000 rotations per minute. The analysis of its operation showed that drilling itself occupied 21.1% of the working time. The rest was occupied by erection-dismantling and other operations. Many parts of the rig were inadequate and needed further adjustment. After the changes, the rig could be recommended for drilling prospecting

TITLE: Field of velocities for some cases of axisymmetric deformation of tubular stock

SOURCE: Samoletostroyeniye i tekhnika vozdushnogo flota, no. 4, 1965, 116-117 18

TOPIC TAGS: shell theory, cylindrical shell, metal deformation, deformation rate

ABSTRACT: The author considers the process of axisymmetric deformation of a tubular workpiece under the effect of an internally applied load to determine the velocity of the particles of deformed metal as a basis for describing the state of the material at any moment during the deformation process. The equation of continuity is given for plastic flow of the metal during deformation assuming that the material is incompressible. An expression is derived from this equation for the radial velocity field in terms of an arbitrary function with respect to the vertical coordinate. Boundary conditions are used for determining this function. It is found that the radial velocity of the metal particles varies hyperbolically as a function of the radial coordinate if there is no axial displacement. The change in radial velocity as a function of the vertical coordinate is determined by distortion of the cylindrical generatrix during deformation. Orig. art. has: 1 figure, 9 formulas.

TITLE: Some characteristics of the process of pipe expansion in a tube plate

SOURCE: Samoletostroyeniye i tekhnika vozdushnogo flota, no. 4, 1965, 118-120

TOPIC TAGS: pipe, steam boiler, hermetic seal

ABSTRACT: Formulas are given for calculating the tightness between a pipe and tube plate after expansion. It is assumed that the pipe and the plate are incompressible throughout the entire deformation range and may be treated as ideally plastic bodies. Axial displacement of the pipe and tube plate during expansion are disregarded, and plate deformation does not pass the elastic limit. An approximate formula is derived for the outside radius of the pipe in the permanently deformed state. It is shown that joint tightness depends on the mechanical properties of the pipe material, deformation of the tube plate, pipe thickness and the initial radial clearance between the pipe and the tube plate. Tightness increases with pipe thickness, pipe deformation and the Young modulus of the pipe material. Tightness is also higher for pipe materials with a low elastic limit and for small clearances between pipe and tube plate. Orig. art. has: 3 figures, 23 formulas.

TOPIC TAGS: tracked vehicle, tractor, tractor maintenance, tractor test stand, test stand, test method

ABSTRACT" An Author Certificate has been issued for a stand for testing tractors, which includes a frame, braking units, rails, a wheeled carriage with supports, and tension members. In order to decrease carriage vibration and noise during the tractor tests, the axles of the carriage wheels, which are mounted in stirrups, are articulately fastened to the frame; at the other end they are connected by a nut which interacts with the supporting screw. In a variant, on the lower part of the carriage frame are mounted female guide rails and fixing brackets with clamping

screws. Orig. art. has: 1 figure.

TITLE: Employment of Floating-zone Refining to Produce Single
Crystals of Silicon (Primeneniye bestigel'noy zonnoy plavki
dlya polucheniya monokristallov kremniya)

PERIODICAL: V sb.: Vopr. metallurgii i fiz. poluprovodnikov. Moscow, AN
SSSR, 1957, pp 35-40

ABSTRACT: The melts were made in an apparatus consisting of a vertical quartz tube (d=22 mm) in which a Si bar was placed vertically on two pins rotating at 1 to 50 rpm. The inductor (d=25 mm, height 4-6 mm) creating the zone was fed from a 5-kv generator working at 4 mc. The rate of motion of the bar relative to the inductor was 0.5-10 cm/hr. A vacuum of the order of $1-10^{-5}$ mm Hg was created in the quartz tube. The specimen was heated to 700°C by current passing through it. Elongated bars 15-20 cm long and 10-13 mm in cross section, and specimens of Si iodide in the form of tubes 8-16 mm in diameter, filled with pieces of Si, were used for the melts. The quartz tube was replaced after 3 to 5

Employment of Floating-zone (cont)

passes due to the growth within it of a film that screened the field. When an asbestos cylinder ~5 cm long was mounted on the tube for purposes of heat insulation in the vicinity of the inductor, checking and crumbling of the film diminished. The course of the melt was followed visually after the first pass and thereafter by instruments. Single crystals were obtained from the superheated zone after 4 to 7 passes when the rate of motion of the zone was 3-6 cm/hr. The employment of single-crystal seeding and rotation of the specimen facilitates production of single crystals. It was established that 6 to 8 passes of the zone make it possible to purify acid-washed Si until it is spectrally pure for 60-80% of the total length of the specimen, but the resistivity of the specimen rises little as this occurs, viz., from 0.05 to 0.08 ohm/cm. Floating zone refining of a specimen of Si with introduction of Ta¹⁸² into the final zone makes it possible to purify the specimen of Ta to 10⁻⁵-10⁻⁸% after 1 to 7 passes of the zone. The Ta is concentrated in the final portion of the bar. The concentration of Fe⁵⁹ after the first pass drops to 10⁻⁴%, and the Fe is concentrated in the final zone. Si iodide yielded single crystals that were chiefly of the p type and had a resistivity of 15-40 ohm/cm.

TITLE: Testing a Foam-type Dust Collector With Dusts of the Ust' - Kamenogorsk Lead-zinc Kombinat (Ispytaniye pennogo pyleulovitelya na pylyakh Ust' - Kamenogorskogo svintsovo-tsinkovogo kombinata)

PERIODICAL: Sb. materialov po pyleulavlivaniyu v tsvetn. metallurgii. Moscow, Metallurgizdat, 1957, pp 343-351

ABSTRACT: An examination of the results of testing of the foam-type dust collector (FD) in the recovery of Pb dusts and ZnO. An FD consisting of a rectangular chamber (cross section of the operating part 0.16 m²) with three consecutively placed screens was used in the experiments. Gas was fed into the FD through the lowest grid by a 2000 m³/hour ventilator. Efficiency of recovery of Pb dusts (in sintering and smelting shops) was 48.1 - 81.6%, with an initial dust content of 1.33 - 4.28 g/nm³ of gas delivered, a 1.14 - 3.4 m/sec gas velocity in the FD, and a consumption of water of 0.67 - 2.47 liters/nm³ of gas delivered. The hydraulic resistance of the FD amounted on the average to 200 mm water column. A great amount of spray droplets
