

required number of products are obtained, correlation or of the autocorrelation function) to the output circuit. This circuit records the values in numerical or analogue form. A synchronizer controls the operation of the correlator. The input circuit is still in the developmental stage and has not been built yet. The pulse counter has a capacity of seven binary series and is constructed with the type 56NU70 transistor. The summation unit uses type 103NU70 transistors and type 5NN41 diodes. The frequency of the synchronized pulses is 50 kc, the addition time is 20  $\mu$ sec; the total period for the summation of a single product, then, is 140  $\mu$ sec. The integrating circuit, which has not yet been built, must ensure the parallel computation of 500 products of the numbers A and B. At the present time the synchronizer is in the process of being built and the multiplier is being perfected. The construction of this special computer, which the teaching staff of the department of radar is

Card 3/4

L 26339-65

ACCESSION NR: AT4042075

carrying out, is a very important step towards combining the teaching of students with practical activity. The computer itself will be an important aid to the teachers and other staff members of the department in the study of problems of statistical dynamics, which the current development in associated fields demands. The Levenspiel-Walton model for heat transfer between a fluidized bed and a wall. R. Ruckenstein and V. Schorr. *Acad. rep. populare Romine, Inst. energet., Studii cercetari energet.* 8, No. 1, 7-18(1968).—An improvement in the model suggested by Levenspiel and Walton (*C.A.* 48, 5582h) for heat transfer between a fluidized bed and a confining wall is proposed:  $\alpha D_p / \lambda = 0.68 [u_w / (u_w + 2\sigma)]^{-1.4} \times (u_w D_p / \nu)^{0.4} Pr^{1/4}$ , where  $\alpha$  is the coeff. of heat transfer,  $\lambda$  the coeff. of thermal cond.,  $D_p$  a distance given by  $D_p = \pi D_p / 6(1 - \epsilon)$ ,  $D_p$  the particle diam.,  $u_w$  the av. velocity,  $\sigma$  the rate of fall of solid particles near the wall,  $\epsilon$  the fraction of the vol. occupied by the fluid,  $\nu$  the kinematic viscosity, and  $Pr$  the Prandtl no. It is assumed that the boundary layer near the solid surface is destroyed by the moving particles of the bed. The relation derived gives better agreement with exptl. results than the Levenspiel-Walton equation. Werner Jacobson

Title : Study of the Steady State Fluidization Process

Orig. Pub. : Rev. chim., 1958, 9, No 9, 482-490

Abstract : Experiments were conducted on fluidization of sand and glass beads with air, water, and ligroin. As a result of the experiments and of an analysis of experimental data of other investigators it was ascertained that the curve representing the friction factor  $\lambda$  as a function of  $Re$  shows a break at the point  $Re = 2$ , which indicates the existence of two modes of fluidization: laminar ( $Re < 2$ ) and turbulent ( $Re > 2$ ). It was found that in the steady state fluidization process the form coefficient is the coefficient of proportionality which depends also on the properties of the fluid. -- Z. Khaimskiy.

TITLE: Kinetic relations applied to the calculation of the thermic stresses of an equiflux furnace for thermal reforming

SOURCE: Petrol si gaze, v. 16, no. 2, 1965, 119-127

TOPIC TAGS: industrial furnace, thermal stress

ABSTRACT: The authors elaborate a unified kinetic calculation method to determine the heating-reaction zone based on published experimental data, and compare the results obtained by applying the calculations with the results measured in an industrial furnace. An example of technological research on an equiflux furnace for thermal reforming is also included, with the pertinent calculations and measurements. It is shown that calculated data are in good agreement with the experimental ones. Orig. art. has: 8 figures and 8 tables. [JPRS]

Abstract : As 1 ml of a 0.1 percent adrenalin solution (I) was injected into male frogs, a rapid secretion of sperm occurred in 100 percent of the cases, but if 0.5 ml were injected, this phenomenon occurred in 30 percent of the cases only. As gonadotropic hormones (GH) were introduced, sperm secretion began one hour after GH was administered. If GH (10-20 ml of a pregnant woman's urine) were administered

Orig Pub. : Studii si cercetari stiint. Acad. RPR. Baza Timisoara.  
 Ser. stiinte med., 1956, 33, No. 1-2, 71--100

Abstract : Small doses of adrenalin (0.1--0.5%) produced only a pressor effect (blood pressure was recorded directly) upon anesthetized dogs. At doses of 0.5--10% the pressor effect was followed by a depressor effect, which, as the dose was pushed higher, disappeared with the development of bradycardia. Vagotomy and atropinization of the animals eliminated the bradycardia, but the depressor reflex was preserved. When the carotid sinuses were treated with novocaine, both the bradycardia and the depressor effect disappeared. The reduction in pressure did not appear even when the spinal cord was transected above the vasomotor centers. The depressor effect arises in response to the rise in pressure produced by the adrenalin; its afferent fibers originate in the sinocarotid zone. Hypotension plays a compensatory role in the development of hypertension. In anesthetized dogs equalization of the pressure occurred more rapidly, by-passing the phase of increased pressure. --E.M. Sheyman

Asthma by Histaglobine"

Budapest, Orvosi Hetilap, Vol 107, No 27, 3 Jul 1966, pp 1267-1270.

Abstract: Twenty-two cases, including two suffering from asthma, 18 from tuberculosis-asthma, 1 from migraine, and 1 from drug urticaria, were treated with Histaglobine, a histaglobuline complex antigen providing active antihistaminic immunization. In only six cases was there any evidence of improvement. The causes for the low response, contradicting some other reports published in the literature, were discussed. 50 references, including 10 German, 6 Hungarian, and 34 Western.

Title : Determination of Trypsine Toxicity by Intravenous Injection in Rabbits.

Orig Pub : Vnitřní Lékarství, 1955, 1, No 11, 809-815

Abstract : A dose of 3 mg/kg of Trypsine(I) administered by intravenous drop (in 100 ml of physiological solution at a rate of 12-14 drops per 1 min) to rabbits, failed to kill the animals; 5 percent of the animals perished from a 5 mg/kg dose; 7 mg/kg caused death of 30 percent, 10 mg/kg - 50 percent of the animals. Following 7-10 mg/kg doses of I, blood fibrinogen decreased sharply, hemorrhages and necrosis appeared in the internal organs and death followed as a result of thrombosis in the right heart and large vessels. Preliminary injection of heparin (110 units/kg) prevented

"Treatment of Inflammatory Thrombophlebitis by a Protease Inhibitor From Potatoes"

Prague, Casopis Lekarů Ceských, Vol CII, No 29-30, 12 July 1963, pp 624-627.

Abstract [Authors' English summary]: Described is the use of Inhibin, a protease inhibitor from potatoes, prepared by Dr HLADOVEC and Engr MANSFELD of the Research Institute for Pharmacy and Biochemistry (Vyzkumny ustav pro farmacie a biochemie) in Prague. The preparation has some similar properties to butazolidine, and was administered to 30 patients with inflammatory venous thrombosis. Inhibin lacks toxic properties and its side effects are mild. The Inhibin treatment of the above disease was 1/2
