TITLE: Investigating static and fatigue strength of aluminum alloys AV, D16, and V95

SOURCE: Vsesoyuznyy nauchno-issledovatel'skiy institut burovoy tekhniki. Trudy, no. 12, 1964. Buril'nyye truby iz lekkih splavov (Drill pipes made of light alloys), 26-47

TOPIC TAGS: aluminum, aluminum alloy, steel, metal breaking, metal corrosion, metal failure, metal fatigue, static testing, fatigue, fatigue strength/ AV aluminum, D16 aluminum, V95 aluminum, D steel, M steel, T15K6 hard alloy, GOI paste, NU testing machine, 1A616 lathe, SGP1 hydraulic copying device

ABSTRACT: Static and fatigue strengths of the aluminum alloys AV, D16, V95 were tested. Their properties were compared to those of steels D and M used in drill-pipe production and were tested under identical conditions. AV and D16 underwent additional testing for tensile strength in impact, ductility, and resistance to ring flattening. Mechanical properties of D16 and D, when subjected to a 45-day corrosion in drilling mud, in a stressed state, did not change. The static strength of AV, D16, and V95 was respectively: high, medium, and low. Most of the pipe failures

Card 1/4

1-32722-65

ACCESSION NR: AT5004707

were caused by stress concentration, corrosion in the circulation fluid, and weakening at couplings and joint threads. Fatigue strength was measured in the NU device designed for testing pipes and rods $\ell = 226$ mm, $d = 17$ mm in fluid. Repeated variable loads were applied according to the scheme shown in Fig. 1 on the Enclosure, where P is the force producing continuous bending moment M along the whole sample, a is the distance between the points of support and force application, d is the sample diameter. The metal fatigue limit was assumed to equal the largest stress withstood without failure (in air and in drilling mud) for 20×10^6 cycles at $n = 3000$ revolution/min. Two specimens of each metal were machined in a hydraulic copying lathe 1A616 equipped with the SGP1 copying device, with high-speed steel blades for aluminum and the T15K6 hard alloy blades for steel D. One of the specimens was polished. The polished pipe and rod specimens tested in air showed the highest fatigue resistance. Lowering of strength by stress concentrations at structural details was investigated in pipes with a single groove and in threaded specimens. This effect was found practically equal in all aluminum alloys, and it was greater in aluminum than in steel D. With the gradual increase in static strength, the endurance limit of grooved specimens increased at a different rate. The effect of corrosion was tested in the NU assembly shown in Fig. 2 on the Enclosure, which provided for mud circulation, mixing, and the necessary insulation of machine parts from the liquid. The test installation consisted of a box (2) fixed rigidly to the machine pedestal (1), a lid (8), and a rubber layering (7). Grooved Card 2/4

L 32722-65 ACCESSION NR: AT5004707	<p style="text-align: right;">2</p> <p>textolite disks (5) are fixed to the upper part of the box (2). Rubber deflectors (3) are placed on the sample (4). They do not touch the disks (5) but protect the machine parts from the liquid. Drilling mud is supplied through the connecting pipe (6) by a centrifugal pump with an electric motor synchronized with the motor of the testing machine for a simultaneous on- and off-switching. The AV alloy showed a satisfactory resistance to corrosion, D16 was less resistant, and V95 was more resistant in the machined specimens, but lower in the polished ones. Fatigue ruptures of the alloys were all perpendicular to the axes of specimens tested in air. Those tested in fluid showed several failure centers with fractures perpendicular to axes in AV and V95 but at an angle to the axis in D16. The best combination of static load and fatigue resisting properties under working conditions was found in the D16 alloy. Orig. art. has 25 figures, 13 tables, and 7 formulas.</p>

Title : Simplified variation of actograph

Periodical : Fiziol.zhur. 2, 237-238, Mar/Apr 1954

Abstract : Simplified variation of an actograph for mechanical recording of behavior and activity cycle of animals is described. A diagram of the actograph and a sample actogram are presented. It is claimed that this actograph is superior to any other previously used because it is inexpensive, has greater sensitivity, and records clearly on any kind of paper. Illustrations. One USSR reference.

TITLE: The higher nerve activity of adult rats, irradiated daily with X-rays during the embryonic period

SOURCE: Piontkovskiy, I.A. Vliyaniye ioniziruyushchego izlucheniya na funktsiyu vysshikh otdelov tsentral'noy nervnoy sistemy potomstva. Moscow, Medgiz, 1961, 79-101

TEXT: A study was conducted of the effects from small, fractionated daily doses of ionizing radiation, on the embryo to determine: 1) Whether 10 or 1 r doses cause changes of the higher nerve activity in the adult state and 2) whether the effect depends on the dose. The PYM-3 (RUM-3) X-ray apparatus, 190 kv, 15 ma, 0.5 mm copper and 1 mm aluminum filter, focal distance 3 m, 1 r/min energy - was used to irradiate the pregnant rats. Testing of the higher nerve activity, according to the Kotlyarskiy method, was started on the 42nd day of postnatal development, in three stages: a) Formation of conditional reflexes, b) work in the stereotype, c) func-

Card 1/4

The higher nerve activity of adult ...

tional testing. 65 female rats were irradiated, subdivided into 3 groups: 23 offspring irradiated with 10 r each, 22 - with 1 r each, and 20 control rats. Systematic irradiation of the mother rats caused a drop in the leucocyte count toward the end of pregnancy; most significantly noted in the 10 r group. No other signs of radiation sickness occurred. A statistical analysis of about 150,000 figures, obtained from the 65 rats, during formation of conditional reflexes, work in the stereotype and 6 functional tests, revealed the following facts: Difference in the higher nerve activity of rats irradiated repeatedly in the antenatal stage, as compared to non-irradiated animals. These differences were as follows: The irradiated animals showed changes in all the properties of the stimulation and inhibition processes. The strength of stimulation and internal active inhibition was lower. The equilibrium of stimulation and inhibition processes was destroyed, shifting toward a predominance of either stimulation or inhibition. The mobility of these processes was reduced. Thus, it is determined that systematic irradiation of rats in the embryonic period, with 10 or 1 r daily, leads to a change of the higher nerve activity in these rats during the adult stage.

X

Card 2/4

33077
S/636/61/000/000/005/013
D298/D303

The higher nerve activity of adult ...

This change is reflected in an impairment, weakening of all the main properties of the stimulation and inhibition processes. The relationship of the higher nerve activity changes to the applied dose could only be determined through quantitative characteristics of the stimulation and inhibition processes which, in turn, are judged from various indices of the higher nerve activity. Over 100 obtained statistical facts led to the conclusion, however, that a higher dose has a greater destructive action. The destructive effect is found to increase to a lesser degree than the irradiation dose. A comparison of several indices of the destruction degree of the higher nerve activity in rats, irradiated with a single dose, showed the former to have a much lesser destructive action. The following general conclusions were drawn: 1) Daily irradiation of pregnant rats with X-rays in doses of 10 and 1 r (total of 200 r and 20 r) causes malformations in the offspring, in about 4 - 8 % of the cases; an increased mortality in the early postnatal period, subsequent increased illness. 2) According to actographs on the 3rd week of postnatal development, the irradiated rats, as compared to the normals, showed an increased mobility and subsequent drop. A

Card 3/4

X

33077

The higher nerve activity of adult ... S/636/61/000/000/005/013
D298/D303

particularly sharp drop in the mobility is noted at the 4th week of the life. The development of mobility in irradiated rats is delayed. The 10 r dose has a greater effect than the 1 r dose. 3) The conditional reflex method points out a weakening in the force of stimulation and inhibition in adult animals, irradiated daily during the antenatal period with doses of 10 and 1 r. The equilibrium and mobility are impaired when irradiation with both 10 and 1 r doses is performed, although apparently to a lesser extent than the force of stimulation and inhibition. 4) Destruction of the connecting function was noted in all the irradiated rats: The connecting function was severely impaired in two out of 45 irradiated rats. 5) A lesser number of animals with a strong higher nerve activity and a greater number of weak animals, with impaired equilibrium and inertia, were noted in the irradiated groups. 6) A lower absolute and relative brain weight, and also a thinning of the brain cortex was noted in rats, chronically irradiated antenatally. 7) The destructive action depends on the dose. The 10 r dose has a greater effect than the 1 r dose, both on the higher nerve activity as well as on the brain weight. There are 11 figures and 8 tables.

TITLE: Conditioned reflexes in rats exposed to a single irradiation with x-rays in a dose of one r in the period of antenatal development

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 60, no. 9, 1965, 43-46

TOPIC TAGS: conditioned reflex, rat, x ray irradiation, brain, biologic reproduction, radiation biologic effect

ABSTRACT: Thresholds of radiation injurious to the brain of the rat fetus were determined. On the 18th day of gravidity the abdominal wall of the animals was opened and the uterus was exposed. The rest of the body was protected by a lead shield. The uterus containing the fetus was then subjected to irradiation by x-rays in a dose of one r. After the radiation treatment the uterus was returned to the abdominal cavity and the abdominal opening was sutured. The control rats, also in a state of gravidity, were similarly treated without being subjected to irradiation. The births were natural, with eight of the animals having given birth to 53 antenatally irradiated young rats, and eight of the controls, to 62 nonirradiated young rats. At the age of 45 days the offspring of the irradiated and control

rats were studied with regard to their responses to conditioned reflexes. It was found that conditioned reflexes to light and sound were stabilized at a considerably slower rate in the irradiated than in nonirradiated young rats. Further studies established a definite impairment of internal inhibition in the experimental animals as compared with the control rats. The experiments thus definitely established that irradiation of rats with x-ray doses of one r on the 18th day of embryonic development disturbs the inhibition and excitation functions of the brain of the offspring. TITLE: Device for stabilizing the average value of a regulated periodic quantity.
Class 21, No. 175104.

SOURCE: Byulleten' izobreteniya i tovarnykh znakov, no. 19, 1965, 32

TOPIC TAGS: automatic regulation, voltage stabilization

ABSTRACT: This Author Certificate presents a device for stabilizing the average value of a regulated periodic quantity. The device contains a nonlinear unit with saturation and dynamic sections in the direct circuit and a ripple filter in the main linear feedback circuit (see Fig. 1). To increase the accuracy of stabilizing the regulated parameter, the main feedback circuit is spanned by two limiting units whose inputs are connected through attenuators determining the cutoff level to the output of the ripple filter.

TITLE: Certain thermoelectric properties of copper iodide

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,
no. 7, 1962, abstract 7-4-69 i (Dokl. i soobshch.
Uzhgorodsk. un-t, Ser. fiz.-matem. n., no. 4, 1961,
58 - 59)

TEXT: The results of experimental investigations of the temperature dependence of conductivity and thermo-emf are reported. Compressed polycrystalline tablets were investigated, having $\sim 2 \times 10^3 \Omega$ cm resistivity at room temperature. As temperature varies from 200° to 800°C the resistivity increases linearly by $\sim 10^3 \Omega$ cm. The temperature dependence of the thermal-emf was obtained using pressure copper electrodes. The cold electrode was at room temperature, while the temperature of the hot electrode varied from room temperature to 900°C. [Abstracter's note: Complete translation.] ✓

TITLE: Some thermoelectric properties of cuprous iodide

SOURCE: Uzhgorod, Universitet, Doklady i soobshcheniya. Seriya fiziko-matemati-
cheskikh nauk, no. 4, 1961, 58-59

TOPIC TAGS: cuprous iodide, thermoelectric property, resistor, semiconductor,
conductivity, thermocouple

ABSTRACT: This note presents some data on the thermoelectric properties of pressed
semicrystalline "tablets" of cuprous iodide having a resistivity at room temperature of
 2×10^3 ohm/cm. It was found that for the range 20--80C, a 1C increase in temperature
lowered the resistance by 20 ohms. The thermoelectromotive force of cuprous iodide
amounts to $3-5 \times 10^{-4}$ volts/degree. It was found that when the cool electrode is kept at
room temperature, the thermoelectromotive force depends in a linear fashion on the
temperature gradient between the electrodes, varying from 4.6 to 27.6 mv as the
temperature gradient increased from 15 to 75C. Cuprous iodide may therefore be useful
in the measurement of temperature gradients. Orig. art. has: 1 table.

TITLE: Photostimulation and photoelectret state of mercury iodide single crystals

SOURCE: Ref. zh. Fizika, Abs. 6E748

REF SOURCE: Sb. Tezisy dokl. k XIX Nauchn. konferentsii. Uzhgorodsk. un-t,
1965. Ser. fiz. Uzhgorod, 1965, 47-52

TOPIC TAGS: electret, single crystal, mercury iodide, electrometer,
photostimulation

ABSTRACT: It has been found that HgJ_2 single crystals possess electret properties at low temperatures. Investigation was carried out at 77K on single crystals of the red modification of HgJ_2 , grown from a solution in an acetone. To detect the electret state, a standard procedure was used for measuring the polarization value according to the initial deflection of the electrometer upon depolarization by light. It is shown that the photoelectret properties of HgJ_2 are related to adhesion in this compound. F. Nad'. [Translation of abstract]

REF SOURCE: Sb. Tezisy dokl. k XIX Nauchn. konferentsii. Uzhgorodsk. un-t, 1965, Ser. fiz. Uzhgorod, 1965, 72

TOPIC TAGS: photodielectric effect, dielectric constant, space charge, grain boundary; mercury iodide

ABSTRACT: The photodielectric effect has been detected in HgJ_2 . When HgJ_2 placed as a dielectric between capacitor plates was illuminated, an increase in dielectric constant ϵ was observed. At low temperature this change is maintained with time, and with decrease in temperature value ϵ itself decreases only slightly. It is supposed that in HgJ_2 the photodielectric conductivity is linked to the formation of the space charge on the grain boundaries owing to the electron localization in the traps.

Title : The Influence of Diethylstilbestrol on the Increase of Meat Production in Young Cattle (Oliyaniye diethylstilbestrole na povysheniye myasnoy produktivnosti molodnyaka)

Orig Pub : Zhivotnovodstv, 1957, № 5, 54-55

Abstract : Three groups of calves, composed of 7 heads each, were fed wet beet pulp (per head, daily, in kg.) as follows: 1st group 46.0; 2nd group, 39.5; 3rd group, 40.7; diethylstilbestrol was administered (in mg.) as follows: 12, 8, 0, respectively. The other feeds (roughages, concentrates, and molasses) were given in equal amounts to all animals. The calves of the 1st group increased their weight gain by 19 kg., and those of the 2nd one, by 10 kg., as compared with the 3rd group. The slaughter output of meat was 45.7, 44.8, and 44.4% in the 1st, 2nd, and 3rd group, respectively, and the fat output was 3.1, 3.0, and 3.8% respectively.

TOPIC TAGS: surface hardening, metal rolling, bronze / BrOTs6-6-3 bronze

ABSTRACT: The effectiveness of surface hardening of parts by rolling to increase their resistance to wear was investigated under industrial conditions. During the design of friction couples it is recommended to choose the materials according to the operating conditions--high specific loads, low sliding velocities, insufficient or complete lack of lubrication. Chrome plating of the more expensive parts is practical because the wear of chrome-plated shafts is insignificant. Roller hardening of machine parts working under seizure conditions can have significant effects if the correct rolling regime is used. The roller hardening effectiveness depends on the load applied to the roller and the roller shape.

(specific pressure). Increasing the roller profile radius under the same loading conditions decreases the hardening effectiveness. Very high loads on a small profile radius also decrease the effectiveness. The optimum loads on a roller for bronze BrOTsS-6-6-3 are in the range 100--140 kg at a profile radius of 5 mm. 2 illustrations. Bibliography of 7 titles. [Translation of abstract]

PHASE I BOOK EXPLOITATION 707

Tsentral'naya stantsiya yunykh tekhnikov, Moscow

Mezhdunarodnyy geofizicheskiy god, 1957-1958; bibliograficheskaya pamyatka kruzhhkam yunykh uchastnikov MGG (International Geophysical Year, 1957-1958; a bibliographical booklet for groups of young participants in the I.G.Y.) [Moscow, 195-] 9 p. 1,500 copies printed.

Ed.: Stakhurskiy, A. Ye.

PURPOSE: The present bibliography was prepared for the scientist, technician, and amateur, on the pre-graduate level, participating in the program of the International Geophysical Year.

COVERAGE: The bibliography, published by the Central Station of Young Technicians (Tsentral'naya stantsiya yunykh tekhnikov), contains 169 titles of monographs and articles arranged in the following categories: general problems of geophysics and related subjects; manuals; problems and programs of the IGY; research in hydrology and glaciology during the IGY; study of the Arctic and Antarctic during the IGY; studies of the atmosphere, and meteorological observations during the IGY; literature on space rockets and artificial satellites; methods used in amateur scientific observations in astronomy and geophysics; atlases. The literature, all published prior to October 1, 1957, is designed

Card 1/2

International Geophysical Year, 1957-1958 (Cont.)

707

to acquaint the reader with IGY's research programs, some of the equipment and methods used, and the results obtained thus far. Most of the books and periodicals, it is pointed out, may be obtained from libraries only, and are not available at bookstores. The list was compiled by N. K. Semakin. A brief introduction lists the various fields of activity of the IGY, emphasizing Soviet participation and contributions; e.g. one third of all observatories participating are Soviet. Last page lists books published and to be published by the Central Station of Young Technicians which works in close cooperation with the Interdepartmental Committee of the International Geophysical Year, and which coordinates, collects, and processes the observations obtained by the amateur circles.

Babulin (Supr. Ed.), M.M. Davydov, S.G. Kulebin, A.G. Maevovich, P.P.

Paragov.

Purport: The book is intended for astronomers and geophysicists and

physicists interested in astronomical phenomena.

CONTENTS: This yearbook on astronomy was compiled by a number of Soviet

astronomers specializing in several different branches of astronomy.

The following persons participated in the work: I.D. Kondratenko, who wrote the chapters on "Properties of the Sun and Moon"; V.A. Kondratenko, the chapters on planets, ellipses, physical coordinates of the Sun, Moon, Mars, and Jupiter, and the satellites of Jupiter and Saturn; V.S. Larinovskii, the chapters on epicyclides and heliocentric longitudes of planets; V.G. Dandurad, the chapters on occultation of stars and planets by the Moon, observations of Polaris and occultation of occulting stars by minor planets; and N.B. Perov, the chapters on variable stars. The appendices contain articles on recent developments and events in astronomy such as the launching of the first Soviet space rocket, the 10th Congress of the International Astronautical Association held in Moscow in August 1958, developments in astronomy in 1958 during the IAU, "There are 380 references, All Soviet."
