Semeka, Candidate Tech Sci, 11 pp

"Morsk Flot" No 3

Brief description of contemporary marine turbogenerators with the primary objective of greater economy in use of steam. Discusses results of tests conducted on two turbogenerators, similar to those installed in the turboelectric ship the "V. Molotov" (1939), and also on several turboelectric tankers launched in 1944.

TITLE: Determination of the Amount of Heat Recovered (Opredeleniye
velichiny vozvrashchennogo tepla)

PERIODICAL: Tr. Tsentr. n.-i. in-ta mor. flota, 1955, Vol 1, Nr 2, pp 3-8

ABSTRACT: Upon pointing out the shortcomings of the existing methods for the determination of the amount of the heat recovered in the process of the expansion of steam in a multistage turbine, the author proposes a more convenient method of calculation. An expression is derived for the elementary increment of the available adiabatic temperature drop based on a study of the expansion process with due consideration of the internal losses in the T-S diagram; upon summation, the total value of the heat recovered during the cycle is determined.

Thermal calculations for marine steam turbines (Teplovoy raschet sudovykh paroturbinnikh ustavok) Moscow, Izd-vo "Transport," 1965. 259 p. illus., biblio., Errata slip inserted. 2500 copies printed.

TOPIC TAGS: steam turbine, marine engine, marine equipment, thermal calculation

PURPOSE AND COVERAGE: This textbook is intended for marine engineering students at schools of higher education and may also be used by technicians at marine research and development institutes. A new method for calculating marine steam turbines is introduced. This method requires no successive approximations and permits an exact analysis of the effect on a steam turbine of each of its components using steam under any arrangement within the cycle. This method is reported in full for the first time. It has been used by research and development institutes for several years and was used to calculate the steam turbines for such large ships as the "Peking" and "Sofia." Data needed for the practical application of this method are presented in various tables, charts, graphs, and empirical formulas. Examples of the calculations of modern turbines are also given.
