SEPIELAK, Z. Sopielak Z. Arc Welding of Chrome-Molybdenum Steel Pipes.

"Technika lukowego spawania rur chromo-molibdenowych." Przegląd Spawalnictwa. No. 3, 1961, pp. 49-52, 12 figs.

A most detailed description of the technique of welding chrome-molybdenum steel pipes for high pressure and high-temperature steam, used in boiler installations of electric power plants. The method described depends on arc welding pipes prepared at V or U and preheated to 200-300°C., using 2,5 mm electrodes for the first layer, 3.25 mm. for the second layer and 4 mm. for subsequent layers. Annealing for 30 minutes in temperatures of 760° to 920°, according to the composition of the steel, is imperative. Radiographic control, or the Magaflux method, enable any possible welding defects to be removed.

Title : Methods of Control of Lactic Acid Production (3). Gasometric
Determination of Acids Bound by-Lime.

Orig Pub : Chem. zvesti, 1957, 11, No 6, 330 - 339.

Abstract : For the determination of acids bound with lime in wort
(especially in dark wort) for lactic acid production, lime
is precipitated in the neutralized wort with a Na_2CO_3 solu-
tion, CaCO_3 is separated by filtration and the excess of
 Na_2CO_3 in the filtrate is determined gasometrically as CO_2 .

TITLE : Control of fermentation with the Aid of Iodometric
Determination of the Sucrose Content.
ORIG. PUB. : Kvasny prmysl. 1959, 5, No 1, 13-15

ABSTRACT : The iodometric method for the determination of
sucrose (I) was modified for its application in the
process of lactic acid production by fermentation.
This method requires less time for the perfor-
mance of a determination than does Peling's me-
thod. It is more dependable than the polarimetric
method and is applicable to all concentrations
of I encountered. With the aid of the developed
modified method it was established that the in-
version of I does not take place prior to the
fermentation to a degree that was assumed previously.

Budapest, Orvosi Hetilap, Vol 107, No 52, 25 Dec 66, pages 2449-2453.

Abstract: [Authors' Hungarian summary] The more important screening methods (nitrate tests, TTC test, etc.) used in quantitative bacteriology involving the urine are surveyed and the results of comparative studies, using these methods, are reported. Significant bacteriuria was correctly indicated by the simple Gries-Ilosvay type of nitrite test in 55 per cent, by the Sleight type modification of the nitrite test and by the stroke plate technique in 98.5, and by the TTC test in 90 per cent of the cases. The combination of a chemical test and of a semiquantitative culture procedure is considered to be the most suitable method. 3 Hungarian, 30 Western references.

AUTHOR: Seppar, A.M. and Agushevich, I.Z.

TITLE: Control of Heating Coke Ovens Along Their Height. (Regulirovka obogreva koksovykh pechey po vysote)

PERIODICAL: Koks i Khimiya, 1957, No.1, pp. 19 - 23 (USSR)

ABSTRACT: Factors influencing the height and dimension of flame in heating flues and therefore directly influencing the uniformity of heating along the height of ovens were investigated. These factors are: a) the velocity of gas flow at the entrance to heating flues; b) coefficient of air excess, and c) calorific value of gas used for heating. When investigating one of the above factors the remaining factors were kept constant. The uniformity of heating along the height of ovens was determined by measuring temperatures in the tar line at three levels (0.6, 2.1 and 3 m from the oven sole), temperatures of bottom, top and along the height of heating flues. The latter was done by measuring the temperature of a nickel plate immersed to various depths in the flue. From final temperatures in the tar line the weighted mean coke temperatures were calculated by planimentering respective diagrams. Ovens of the type ПК-42 and ПК-49 on the Magnitogorsk Combine (Magnitogorskiy Kombinat) were the object of investigation. The influence of the gas-air stream velocity at the entrance to heating flues was studied on Card 1/3 ovens of the ПК-49 type, fired with blast furnace gas with 3%

Control of Heating Coke Ovens Along Their Height.

68-1-6/21

consumption of heat) the temperature of the lower zones of heating flues increases (Fig. 3). A large number of experimental results obtained during the investigation permitted the deriving of statistical relationship between the temperature of control heating flues and the temperature of the coke (Fig.4). In the temperature range: 1 300 to 1 340 °C on the pusher side and 1 340 to 1 380 °C on the coke side, the relationship is linear. An increase of temperature of a control heating flue by 10 °C increases the mean temperature in the tar line by 36 °C on the pusher side and by 32 °C on the coke side. It is pointed out that increase in temperature is non-uniform; the temperature of the bottom part of the coke increases most. There are 4 figures and 2 tables.

TITLE: An Improvement in the Quenching of Coke (Usovershenst-
vovaniye tusheniya koksa)

PERIODICAL: Koks i Khimiya, 1959, Nr 3, pp 27-34 (USSR)

ABSTRACT: An investigation of the coke quenching process has been studied on the Magnitogorsk Works, the results of which are reported in the paper. The distribution of moisture in the individual size fractions of coke - fig 1 and table 1. The distribution of coke in the quenching car - fig 2 and 3; the distribution of time between the individual operations of the coke quenching car - table 2; the dependence of the coke quenching time on the spraying capacity of the quencher (M^3 of water/min) - table 3; the distribution of moisture in coke on the coke wharf - fig 5 and table 4; the design of the spraying installation used on the Magnitogorsk Works - fig 6. It is concluded that the necessary conditions of the stability of the moisture content of coke is the stability of the quality of the coal blend, heating conditions and coking time, as the above conditions

An Improvement in the Quenching of Coke

determine the size distribution of coke and the amount of sponge it contains. There is a large variability in the distribution of coke on the cross sectional area of the coke quenching car of the same design on various batteries. The duration of the quenching period with technical water is 20-25% lower than that with effluent water. The spraying equipment used on the works is described. There are 6 figures and 4 tables.

ABSTRACT: 1) The first part of the coal beneficiation plant was put into operation. 2) Drying and heating up of a new battery of the PVR system was started. 3) A mechanism for cleaning doors was erected on one of the pushing machines (designed by A.I. Melnikov). Similar mechanisms will be fitted to other pushing machines. 4) One of the service bunkers was fitted with automatically controlled reversible conveyer, operating according to a program. 5) Automation of five quenching towers has been carried out.

TITLE: Smokeless Charging of Coke Ovens (Bezdyrnaya zagruzka koksovykh pechey)

PERIODICAL: Koks i Khimiya, 1959, Nr 6, pp 24-31 (USSR)

ABSTRACT: In 1955 VUKhIN developed a method of smokeless charging of coke ovens with two collecting mains. The basic deficiency of the method was a decrease in the weight of the charge and an increase in the ash content of tar due to carry over of the coal dust during steam injection. In 1957-58 VUKhIN in co-operation with the Magnitogorsk Metallurgical Combine investigated various methods of charging ovens in order to improve the technology of decreasing the amount of dust carried over into the collecting mains. The characteristic features of the methods tested are shown in Table 1 and the dependence of concentration of dust in the gas in ascension pipes on the moisture content and the content of particles below 50 μ in the blend in Fig 1. The best results were obtained when charging was carried out in two stages:

Smokeless Charging of Coke Ovens

SOV/68-59-6-7/25

first through two outside holes simultaneously or in turn charging 12.9 tons (without levelling) and then after 15 - 25 minutes, through the middle hole (3.3 t) and levelling. Under these conditions the carry over of dust into the collecting mains was the lowest (9.85 - 11.8 kg/oven). The method can be used at a moisture content up to 7.5% and with the injection of steam according to the VUKhIN-MMK scheme (Fig 6). The use of vibrating filter screens for the removal of suspended matter from tar was tested with satisfactory results (no details) and will be incorporated into the operation practice on the MMK plant. Continuation of the work on the smokeless charging of coal blends with a moisture content above 7.5% is recommended.

6NVD-48 diesel engine

ABSTRACT: The author describes the new control system installed on the motor ship "Danilo Nechay" in 1964. Two new diesel engines of 6NVD-48 type were also installed. The ship is of Hungarian construction. [Latin letters NV and Russian D are used for designation of the engine type] The system consists of a pneumatic circuit controlling two main engines and an electric circuit for transmitting

ACC NR: AP6019442

orders and signals. The engines are controlled directly from the Captain's bridge including starting, reversing and speed control operations. The performance of remote control system is briefly discussed and some failures in operation are mentioned. Some improvements are recommended such as an automatic recording of time in transmission of orders. An emergency feeding of the control circuit from auxiliary storage batteries is also recommended. The advantages of remote control are stressed and opinion is expressed on applying the control system to operations of compressors and auxiliary equipment.

(Mosk.) 1958, 1 (76-82) Tables 2

Clinical and laboratory examination of carriers of dysentery bacilli, detected during a mass-survey, in the majority of cases gave no reason to consider them as sufferers from dysentery. However, radiological examination of the gastrointestinal tract of 'healthy carriers' could in most cases prove the existence of pathological alterations of a functional or inflammatory character.

AUTHOR: Seppi, I.V., Candidate of Medical Sciences,
Lieutenant-Colonel of the Medical Corps

TITLE: The Clinic of Botkin's Disease

PERIODICAL: Voenno-meditsinskiy zhurnal, 1958, Nr 7, pp 37-41
(USSR)

ABSTRACT: The author bases his article on his own investigations and those of many physicians including Ye.M. Tareyev, Anosov, V.G. Smagin, B.I. Barskiy, V.A. Orlov, E.M. Gel'shteyn, A.I. Yemel'yanov, K.I. Galkina, Kh.Z. Zak and K.A. Treskunov. Proceeding from clinical variants of the disease, the author gives the following classification of clinical forms of Botkin's disease: 1. Characteristic icteric forms: a) mild form, b) middle-serious form; c) serious form. 2. Malignant forms: a) with early acute or subacute dystrophy of the liver; b) with late acute or subacute dystrophy of the liver. 3. Complicated forms:

Card 1/3

SOV/177-58-7-7/28

The Clinic of Botkin's Disease

cal processes. A.I. Yemelyanov and K.I. Galkina concluded that the transition of Botkin's disease to cirrhosis of the liver occurs in latent and mild cases. The author concludes that the frequency of complications and various postinfectious states depend on the seriousness of the course of the infection. The death-rate in Botkin's disease is connected to a large extent with the presence of malignant forms, especially with early acute dystrophy of the liver. There is 1 diagram, 2 tables and 3 Soviet references.

93. Method Developed for Uninterrupted Intraosseous Injections of Antibiotics in Purulent Bone Infections

"Method of Continuous or Repeated Intraosseous Injection of Antibiotics During Purulent Infections of Bones," by Docent. A. I. Seppo, Chair of General Surgery (head, Docent A. I. Seppo) Tartu State University, Vestnik Khirurgii imeni I. I. Grekov, Vol 78, No 4, Apr 57, pp 22-23

Research was started in 1953 to develop the present method for the continuous or repeated injections of penicillin or penicillin and streptomycin in 0.25% novocain solution into the site of suppuration in long bones. This prophylactic method is based on the use of needles (with rubber appliances at their ends) which are inserted into the site of inflammation. The mixture penetrates into the bone marrow canal due to the elastic pressure produced by the rubber cuff.

Experimental results on 10 dogs and 10 rabbits and the therapeutic results on 21 patients were encouraging. The author recommends that this method be used in conjunction with other therapeutic agents during treatment of osteomyelitis and open fractures of tubular bones. (U)

I. Solidification Points of Ethylene Glycol Solutions.

Orig Pub : Chem. zvesti, 1956, 10, No 4, 193-203

Abstract : The solidification points (t) of the following binary systems were determined: ethylene glycol (I) - water (0-60%, 80, 100% of I), diethylene glycol (II) - water (0-65%, 88, 100% of II), triethylene glycol (III) - water (0-50%, 75, 100% of III), I - II (0-40%, 60 and 100% of I), II - III (0-30%, and 70 and 100% of II). New tables of t of binary mixtures were made. t of ternary mixtures water - I - II and water - I - III were determined within technologically important boundaries. Substituting I with an amount of II or III of the same weight raises t.

 Vapor pressure of butyraldehydes. M. Sepráková, J. Paulech, and J. Dyky (Výzkumný ústav ucelivých chem. Nováky, Czech.). *Chem. zvesti* 13, 318-16(1959)(German summary).—The vapor pressure of butyraldehyde (I) and isobutyraldehyde (II) was measured in the range of 100 mm. Hg to 760 mm. Hg. In this range the dependence of pressure on temp. can be expressed by the Nernst equation $\log P^{\circ} = -A - (B/T) + 1.75 \log T + CT$ and are tabulated. The variation of calcd. values from measured ones is for I ± 0.69 mm. Hg and for II ± 0.27 mm. Hg.

 TITLE : Use of Selection Yeast at State Farms and Its
 Importance in the Making of High Quality Wine
 ORIG. PUB. : Rev. gospod. agric. stat, 1958, No 10, 12-16
 ABSTRACT : The importance is noted of a directed and
 controlled (by physical, chemical, and microscopy methods)
 fermentation of must, with the use of selection yeast, in
 the making of high quality wine. Data are presented on
 yeast consumption during 1949-1957, and anticipated con-
 sumption in 1958, at state farms, by regions. While in
 control of 15% of the total acreage of vineyards, the state
 farms utilized in 1956-1957 50% of the total amount of
 yeast expended within the country. -- A. Marin.
