ected by applying a hydraulic load, and can be varied in the range 0.2 - 80 kg. The hydraulic pressure system works with MS-20 oil. In order to eliminate a break of the test specimen in the machine holders, it was turned down according to the method by I. V. Kudryavtsev (Ref 1). The testing machine is schematically represented (Fig 1). Diagrams of test specimens for the wearing- and fatigue tests (Fig 2) are given as well. There are 2 figures and 1 Soviet reference.

AUTHORS: Luk'yanov, A. T.; Sharaya, S. N.

TITLE: Solution of boundary layer problems on static models

SOURCE: AN KazSSR. Vestnik, no. 2, 1965, 63-69

TOPIC TAGS: analog computer, analog system, finite differences method, flow analysis, flow around flat plate, boundary layer, velocity profile

ABSTRACT: The authors have discussed an analog integrator model for solving boundary layer problems and other nonlinear systems. The analog model functions upon the principle of finite difference approximation of the fundamental differential equations. The integrator unit, consisting of several high-resolution functional potentiometers, is shown in Fig. 1 on the Enclosure. Examples of the use of the analog device are given. The first problem solved was the set of equations

$$u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} = U \frac{dU}{dx} + \nu \frac{\partial^2 u}{\partial y^2},$$
$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0,$$

Card 1/5

L 38566-65

ACCESSION NR: AP5007984

describing the laminar boundary layer around a flat plate of infinite length. The plate is set along an axis x , and the flow is that of a viscous incompressible fluid. Boundary conditions taken are

$$u = v = 0 \text{ for } y = 0,$$

$$u = 1 \text{ for } y \rightarrow \infty.$$

The system may be reduced to the finite difference form

$$\frac{u_{n,k+1} - u_{n,k}}{\Delta x} = \frac{v}{(\Delta y)^2} \frac{1}{a} \sum_{i=1}^a \frac{1}{u_i} (u_{n-1,k} - 2u_{n,k} + u_{n+1,k}) -$$

$$- \frac{1}{b} \sum_{i=1}^b \frac{v_i}{u_i} \frac{1}{2.5y} (u_{n-1,k} - u_{n+1,k}),$$

$$v_{n,k+1} = v_{n,k} + u_{n,k} - u_{n,k+1}$$

$$a = \frac{u_{n,k+1} - u_{n,k}}{N}, \quad b = \frac{v_{n-1,k} - v_{n+1,k}}{N}, \quad N = 0.001$$

The analog forms compatible with the model discussed are written as

Card 2/5

L 38566-65

ACCESSION NR: AP5007984

$$V_{n,n+1} - V_{n,n} = \frac{1}{2+R/R_0} \frac{1}{a} \sum_{i=1}^c \frac{1}{V_i} [(V_{n-1,n} - 2V_{n,n} + V_{n+1,n})] - A \frac{1}{b} \sum_{j=1}^b V_j' (V_{n-1,n} - V_{n+1,n})$$

$$\frac{v \Delta x}{(\Delta y)^2} = \frac{1}{2+R/R_0} \frac{1}{a} \sum_{i=1}^c \frac{1}{u_i} = \frac{1}{a} \sum_{i=1}^c \frac{1}{V_i}$$

$$\frac{1}{b} \sum_{j=1}^b \frac{v_j}{u_j} = \frac{1}{b} \sum_{j=1}^b V_j' \frac{1}{2\Delta y} = A$$

A brief treatment of analog proportionality constants is given, and the solution of the velocity profile by finite difference is demonstrated graphically. A second example problem, that of outflow from an annular channel with a coaxial cylindrical rod, is solved in a similar manner, and the third example is a solution of the boundary layer in the presence of a chemical reaction on the surface of a catalytically active plate. The model is described as being useful in applied and academic research. System accuracy can be made high by proper grid space selection. Orig. art. has: 10 equations and 5 figures.

TITLE: Some data on the polymerization of ethylene on chromia
catalyst

PERIODICAL: Neftekhimiya, v.1, no.6, 1961, 780-785

TEXT: The object of the work was to continue the investigation of ethylene polymerization process on chromia catalyst in order to elucidate the nature of the catalytic activity. The chromia catalyst was deposited on alumino-silicate obtained from silica gel covered with 3% wt of Al₂O₃. One portion of the catalyst was activated in N₂ (dry air stream) for 4 hours at 500°C. The other portion was activated under vacuum at 350°C for 4 hours. Both catalysts contained 3% wt Cr. The quantities of Cr⁶⁺ were 1.25 and 1.96% wt for the catalysts activated under vacuum and in N₂ respectively. Experiments were carried out at several temperatures between 40 and 135°C. Ethylene was fed into reactor at the rate of 40 ml/min and each experiment lasted 40 min. Activity of the catalysts was obtained from the increases in their

easily reduced. This did not apply to the catalyst activated under vacuum (containing chromium chromates) which was much more difficult to reduce. The formation of the reduced form of chromium was confirmed by electron paramagnetic resonance spectra. There are 2 figures.

TITLE: Investigation of chromic oxide catalysts for polymerisation of ethylene by the method of electron paramagnetic resonance

PERIODICAL: Neftekhimiya, v. 2, no. 1, 1962, 18-20

TEXT: The aim of this study was the verification of the hypothesis, previously expressed by the authors, that the activity of the catalyst is produced under the action of the reacting substance, ethylene. Experiments on polymerisation of ethylene over chromic oxide catalysts were carried out and the EPR spectra of the catalyst withdrawn from the reaction zone at different stages of the process were taken. The catalyst was prepared by impregnating aluminum silicate with an aqueous solution of chromic anhydride and subsequent activation. Two varieties of the catalyst, differing by the method of activation, were used. One was activated in a current of air at 500°, the other one— under vacuum at 350°. The catalyst activated under vacuum displayed an induction period. The EPR spectra of the two varieties of catalyst, taken at identical stages of the polymerisation process, were found to be practically identical with respect both to the line width and the value of

Card 1/2

Investigation of chromic oxide catalysts...

S/204/62/002/001/001/007
1032/1232

the g factor (which was 1.97). The identity of the active centres in the two varieties of the catalyst was thus established. The observed narrow EPR line is attributed to a compound of quinquevalent chromium and the Cr^{3+} ions are considered to constitute the active centres. The induction period in the catalyst activated under vacuum is interpreted as the time necessary for the reduction of Cr^{6+} by ethylene. There are 2 figures.

TITLE: Transition from metal hydrides to π -allyl complexes and the initiation of the stereospecific polymerization of butadiene ³⁸

SOURCE: AN SSSR. Doklady, v. 164, no. 1, 1965, 119-121 ³⁴

TOPIC TAGS: polymer, catalysis, metal hydride, polymerization, stereospecificity, butadiene

ABSTRACT: The reaction of nickel hydrides with butadiene was investigated. It was found that nickel hydrides initiate the cis-polymerization (90%) of butadiene through a stage of π -crotyl complex formation. In other reactions the nickel amount passing to benzene solution was 20% of that calculated for unreacted ethyl magnesium bromide. The gaseous products evolved during the decomposition of the crotyl derivatives of nickel were mixtures of butenes (with a predominant amount of α -butene). The total yield of butenes was more than 1 mole per mole of organonickel compound. The stereospecific polymerization of butadiene with the formation of 1,4-polymer was investigated using nickel on kieselguhr and Raney

4
nickel as catalysts (at 32-42C, for 3 hours) and using benzene and heptane as solvents (at 45% by volume butadiene concentration) in the presence of $TiCl_4$, VCl_4 , $AlCl_3$. The tabulated data show that the nature of the metal in the Lewis acid does not affect the microstructure of the polymer chain. The polymerization is effective in both benzene and heptane. Considering the data of nickel transition reacted with butadiene to π -crotyl derivatives, it can be assumed that analogous reactions occur on the surface of nickel catalysts. *Detection and frequency of enamel hypoplasia (Russian text) STOMATOLOGIJA 1953,
3 (23-27) Tables 2

Thanks to public health care of children in the USSR the frequency of enamel hypoplasia has decreased significantly in the last decades. It seems that hypoplastic teeth are more easily attacked by caries than normal ones. The common assertion that enamel hypoplasia is found more frequently in males than in females could not be verified.

TITLE: Characteristics of light propagation in a turbid medium illuminated by a narrow beam of light

SOURCE: Optika i spektroskopiya, v. 18, no. 4, 1965, 698-703

TOPIC TAGS: turbidity, light scattering, milk, aerosol scattering, aerosol

ABSTRACT: An experimental analysis was made of the effect of the parameters of a medium on the scattering of narrow light beams. The experimental setup consisted of a glass tank (50 cm³) filled with a highly turbid medium (milk) and illuminating and receiving devices. An optical system was used to introduce a narrow parallel beam of light from a PRK-4 lamp into the tank from above or from below. The beam was subsequently scattered. The illuminating system was equipped to accommodate light filters, polaroids, and diaphragms. An FEU-25 photomultiplier was used to study the illumination in various parts of the medium. The photomultiplier, placed in the tank so that it was 15 cm from the segment whose intensity was being measured, was connected with that segment by means of a light tube. The optical characteristics of the medium (natural indices of scattering σ and absorption k)

0

were measured by means of an attachment to the SF-4 spectrophotometer, described earlier by the author (Izv. AN BSSR, Ser. fiz, no. 2, 1962, 39). It was shown that in a given range of concentrations, σ and k are proportional with respect to the amount of milk and dye (aniline black), and the attenuation factor (α) of the dye in milk was equal to the sum of σ and k . This suggests that with a change in concentration no physicochemical transformations (e.g., coagulation) occur and no cooperative phenomena are present. An empirical formula was devised for computing the illumination at great depths and at distances sufficiently far from the region in which the narrow light beam is propagated. The formula, however, holds only for large values of the lifetime probability of a quantum. Practically speaking, the characteristics of a light field remain invariant to the degree of polarization for any specific absorption k/σ , a conclusion which is significant in the study of polarization phenomena and the theory of radiative transfer. Orig. art. has: 1 table, 3 formulas, and 5 figures. [YK]

- Translation from: Referativnyy Zhurnal, Elektrotehnika, 1957,
Nr 2, p.192 (USSR)
- AUTHOR: Sharberg, B.I.
- TITLE: Automatic Crane Scales (Avtomaticheskiye kranovyye
vesy)
- PERIODICAL: Tr. Tsentr. n.-i. in-ta mor. flota, 1955, 1, Nr 3,
pp.82-92
- ABSTRACT: Automatic weighing is done during the crane loading cycle
by totalling the weighing in the crane control cab which is
connected by cable with the suspended scales. The number
of weighings is recorded by a separate counter. Weighing
accuracy is 1.1 per cent. The weighing element is a
dynamometer of special steel which has an error of not
more than 0.3 per cent of the maximum scale indication.

AUTHORS: Shardanov, A. Kh., Shevchenko, V. G.TITLES: An investigation of the $\text{Li}^7(\gamma, p)\text{He}^6$ reactionPERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42,
no. 6, 1962, 1438 - 1441

TEXT: The $\text{Li}^7(\gamma, p)\text{He}^6$ reaction was investigated using the betatron of the NIIYaF MGU with $E_{\gamma\text{max}} = 16.5$ Mev. Cross section, energy distribution and angular distribution of the photoprotons were measured. The excited levels of the Li^7 nucleus could be determined. The peaks in the photoproton energy distribution (2.3, 3.2 and 3.9 Mev) correspond to the 12.5, 13.5 and 14.3 Mev excited levels of the Li^7 nucleus. The cross sections are: $\sigma_{12.5} = (1.2 \pm 0.5) \cdot 10^{-27} \text{ cm}^2$; $\sigma_{13.5} = (0.5 \pm 0.25) \cdot 10^{-28} \text{ cm}^2$; $\sigma_{14.3} = (0.4 \pm 0.2) \cdot 10^{-28} \text{ cm}^2$. The spins of the levels (Table 1) are discussed. There are 3 figures and 2 tables.

Problem of the Phenomena of Tegmental Tectonics in Southeastern Caucasus
Dokl. AN Azerb. SSR, 9, No 2, 1953, 439-444 (Azerbaijdzhani resume)

Earlier unknown tectonic coverings have been observed in the upper reaches of the Firsagat and Kozluchay Rivers. The studied region enters the zone of the southern slopes and is disposed between the anticlinoria of the Glavnyy and Vandam ranges. The dimensions of the covering, called Sardykhan, are 4 km wide, 6.5 km long, and 300-400 meters thick. (RZhGeol, No 1, 1954)

Title : The tectonic position of the Apsheron peninsula in the system of Greater Caucasia

Periodical : Izv. AN SSSR. Ser. geol. 1, 80-92, Jan-Feb 1955

Abstract : Basing their considerations on the comparison of already known new factual geological material obtained in recent years, the authors analyze the question of the tectonic position of the Apsheron peninsula in the system of Greater Caucasia and arrive at the conclusion that it lies within the limits of the eastern boundary of the zone of the southern slope of Greater Caucasia. Akademiya nauk Ukrainekey SSR. Institut geologii poleznykh iskopyayemykh

Problema migratsii nefiti i formirovaniya neftyanykh i gazovykh skopleniy; materialy Lvovskoy diskusii 8-12 maya 1957 g. (Problem of Oil Migration and the Formation of Oil and Gas Accumulations: Materials of the Discussion Held in Lvov, May 8-12, 1957) Moscow, Gosstokhizdat, 1959. 422 p. 1,100 copies printed.

Eds.: V. B. Porfir'yev, Academician of the Ukrainian SSR Academy of Sciences, and S. G. Brod, Professor, Kiev. Eds. P. B. Verbov, M.S. Adzhemiy, P. I. Kozlov, I. O. Brod, Professor, M.S. Lachybenko, V. B. Porfir'yev, Academician of the Ukrainian Academy of Sciences.

PURPOSE: This collection of articles is intended for a wide range of geologists and research workers interested in oil problems.

COVERAGE: Articles contained in this book deal with the problems of migration and accumulation of oil and gas. These problems were discussed in May 1957 at Lvov State University im. I. Franka at a scientific organization by the Ministry of Geology and Mineral Resources of the USSR, the Department of Geology and Oil Exploration of the Lvov Polytechnic Institute, and the Lvov Geologic Society. Theories on the origin of petroleum deposits and the conditions surrounding their occurrence are treated. There are 327 references: 232 Soviet, 86 English, 5 French, and 4 German.
