AUTHOR: Shcherbov, D. P.

TITLE: Eleventh conference on luminescence

SOURCE: Zavodskaya laboratoriya, v. 29, no. 6, 1963, 767-768

TOPIC TAGS: luminescence, molecular luminescence, luminescent analysis, fluorescence, lumogen, luminescent stain

ABSTRACT: The conference took place September 10-15, 1962 in Minsk and was devoted to molecular luminescence and luminescent analysis. Three hundred and seventy delegates, representing over 100 organizations, took part; the number of papers amounted to 180, of which 60 dealt with analytical problems. Sectional sessions were devoted to the theory of luminescence, optical generation, the triplet state, the relation of fluorescence to molecular structure, the effect of solvents and association of molecules on luminescence, the study of luminescence of frozen solutions (the Shpol'skiy Effect), of inorganic compounds, of films and polymers, chlorophyll, molecular crystals of organic compounds, etc. At the analytical section papers were read on the determination of magnesium, copper, uranium and europium, and on the application of fluorescent analysis in the rare metals industry and in the oil, rubber, and synthetic fiber industry. A number

Card 1/2

L 12775-63

ACCESSION NR: AP3001539

of reports were devoted to uses of the luminescent technique in the location of defects, to luminescent analysis instruments, and to the search for new luminescent reagents as well as to fluorimetric properties of rhodamine metallic complexes. The importance of coordination among the organizations engaged in luminescence research was stressed, especially in the field of new luminescent equipment and lumogens. The need for monographs and textbooks on luminescence was emphasized. The publication of a list of Soviet luminescent materials was recommended. The next conference was scheduled for 1964.

TITLE: Fluorometric determination of rhenium in ores by means of rhodamine 6zh

SOURCE: Zavodskaya laboratoriya, v. 29, no. 7, 1963, 787-789

TOPIC TAGS: rhenium, rhodamine, fluorometric determination, fusion, MgO, Re

ABSTRACT: A weighed sample of the ore is mixed in a porcelain crucible with 3 gm MgO and 0.1 gm potassium permanganate, then heated in a furnace to 650-700°C and held there for 2 hours. The cooled, fused mass is extracted with water, transferred into a flask containing 10 ml of 10-normal sulfuric acid, then diluted with water to the 100-ml mark. A 25-ml portion is transferred to a separatory funnel, to which 1 ml of a 0.1% rhodamine solution is added. After mixing and adding 6 ml of benzene the mixture is shaken, allowed to separate, and the fluorescence of the benzene layer determined (the maximum being located in the 555-560 m μ region). It was found that mercury caused the most interference, although its fluorescence was 100 times weaker. Chromates, permanganates, and tungstates weaken the fluorescence of rhenium, and for this reason their admixture

Card 1/2

L 15667-63

ACCESSION NR: AP3004228

is allowable only up to 100 micrograms for the first two and up to 200 micrograms for the tungstates. Antimony and uranium (when present in quantities of 5-10 mg) raise the fluorescence of 5 micrograms rhenium by 30-40%. The submitted method allows the determination in ores of from 1 to 30 Micrograms of rhenium. Orig. art. has: 3 figures and 2 tables.

AUTHOR: Shcherbov, D. P.

TITLE: Conference on luminescence

SOURCE: Zavodskaya laboratoriya, v. 30, no. 12, 1964, 1525-1526

TOPIC TAGS: luminescence theory, conference report, complex organic molecule, chemiluminescence, organic phosphor, rare earth fluorescence, luminescence application, fluorometric analysis, inorganic analysis, fluorometer

ABSTRACT: The Thirteenth Conference on Luminescence was held in Khar'kov on 25 June-1 July 1964 under the joint sponsorship of the Scientific Council on Luminescence of the Academy of Sciences SSSR, the All-Union Scientific Research Institute of Single Crystals, and the Physicotechnical Institute of Low Temperatures of the Academy of Sciences UkrSSR. Representatives of 108 organizations from 39 cities attended the presentation of 250 papers. The following subjects were discussed: the theory of the luminescence of complex organic molecules, in the solid state, in solutions, and in the vapor state (80 papers); chemiluminescence and its applications; synthesis

Card 1/3

L 21781-65

ACCESSION NR: AP5004255

9

and applications of organic phosphors; fluorescence of uranium compounds and organic complexes of the rare-earth elements; practical applications of luminescence in medicine, microbiology, and some other fields; and fluorometric analysis (about 60 papers). In the fluorometric analysis section, the following papers were the most important. About 30 papers were presented on analytical applications of the Shpol'skiy effect; about 10 papers, on potential analytical applications of various fluorescence phenomena; and 5 papers, on fluorometric equipment including demonstrations of the FAC-1 fluorometer-absorptiometer, the FO-1 fluorometer objective, and a universal ultraviolet illuminator for visual observation.

Ye. A. Bozhevolut'nov reviewed the progress in the fluorometric analysis of inorganic substances. M. A. Tishchenko, L. I. Kononenko, and N. S. Polnektov reported on the fluorometric determination of small quantities of dysprosium and terbium as complexes with pyrazolone derivatives. L. I. Kononenko, R. A. Vitkun, M. P. Nikonova, and N. S. Polnektov presented a paper on the fluorometric determination of small quantities of europium and samarium as complexes with phenanthroline and thenoyltri-fluoroacetone in benzene solution. Ye. A. Bozhevolut'nov and O. A. Fak-

Card 2/3

L 21781-65

ACCESSION NR: AP5C-255

yeva reported on the determination of manganese as crystal phosphors. A. P. Golovina, I. M. Gibalo, L. V. Levshin, and Yu. A. Mitsel' discussed the determination of indium and tantalum in high-purity materials using rhodamines. A paper on the fluorometric determination without reagents of bismuth and lead in hydrochloric frozen solutions was given by Ye. A. Bozh-evol' nov and Ye. A. Solov'yev. D. P. Shcherbov, A. I. Ivankova, and S. A. Voinov reported on the determination without reagents of thallium, using 254 $\mu\mu$ spectral line of Hg for excitation.

The insufficient number of papers on radioluminescence and the absence of papers on laser-excited luminescence were noted. In its resolution, the Conference emphasized the necessity of increasing the investigation of the theory and applications of luminescence.

TITLE: Comparison of the sensitivity of the fluorescent and photometric determination of gallium by means of rhodamine C

SOURCE: Zhurnal prikladnoy spektroskopii, v. 2, no. 2, 1965,
111-114

TOPIC TAGS: gallium, quantitative analysis, analysis sensitivity, fluorescence brightness, benzene extract, optical density, colorimetric analysis

ABSTRACT: The purpose of the investigation was to compare various methods of determining gallium under unified conditions and to establish what gallium content is preferable for use in a particular test variant. The investigation consisted of plotting the absorption and emission spectra of a colored gallium complex with rhodamine C, plotting calibration curves for its fluorescence and photometric determination with various instruments, and calculating the molar coefficient.

Card 1/2

L 58306-65

ACCESSION NR: AP5010038

cient of extinction at various wavelengths. The absorption spectra of the benzene extracts of the gallium complex were determined with spectrophotometers, while the fluorescent spectrum was obtained with a double monochromator. The fluorescent brightness of the solutions was measured with a combined fluorimeter and absorption meter (type FAS-1) and with an objective fluorimeter. Optical density was measured with a photocolorimeter. The concentration limits for the photometry of gallium with various instruments are tabulated. The results show that for an effective batch of 0.1 - 0.2 g, a colorimetric analysis is advantageous if the gallium content is larger than 0.001 per cent; at smaller contents (to 0.0001 per cent), the gallium determination should be completed by a fluorescence procedure. TITLE: Disruption of the processes of bone marrow regeneration

SOURCE: Vosstanovitel'nye protsessy* pri radiatsionnykh porazheniyakh (Recovery from radiation injuries); sbornik statey. Moscow, Atomizdat, 1964, 29-34

TOPIC TAGS: radiation sickness, hematopoiesis, bone marrow, bone marrow regeneration, mitosis, chromosome aberration

ABSTRACT: The cellularity, mitotic index and chromosomal aberrations in the bone marrow were studied in male Wistar rats, irradiated with γ -rays from Co⁶⁰ in doses of 150, 400, 750 and 5000 r at an intensity of 290 r/minute. The results showed marked changes in the quality and quantity of actively dividing cells. These changes were especially acute in the first few hours after irradiation. With an increase in the radiation dose, there was an increase in both depression of cell division and the level of chromosomal aberrations. There was an exponential decrease in the number of cells in the bone marrow, starting 7 hours after irradiation with a dose of 5000 r and continuing until death; there was also complete suppression of cell division at that dose. At doses

Card 1/2

ACCESSION NR: AT4044486

of 400 and 750 r, the same decrease in cellularity was observed, although there was fairly active cell division. The authors conclude that all types and maturation stages of bone marrow cells are equally susceptible to radiation, and that the prevention of bone marrow regeneration is due mainly to qualitative disruption of cell division, as expressed by chromosomal aberrations. On the basis of further analysis, the authors divide the dynamics of chromosomal aberrations into 3 phases regardless of the irradiation dose. The first or plateau phase lasts about 18-24 hours. The next phase involves a sharp decrease in chromosomal aberrations lasting 48 hours, followed by a prolonged "tail". Orig. art. has: 3 figures.

TITLE: Disturbance of cell regeneration in the bone marrow
of rats exposed to ionizing radiation

PERIODICAL: Meditsinskaya radiologiya, v. 8, no. 2, 1963, 35-41

TEXT: The above problem was studied in view of lack of publications concerned with the effect of radiation on the bone marrow. The animals were exposed to whole-body γ -irradiation at 305 r/min, the total dose being 400 r. The rats were then decapitated on the 1st, 3rd, 5th, 7th, 9th, 15th, 20th and 30th day after irradiation and the mitotic index, the development of chromosome observations, the total content of myeloid cells and individual cellular regenerations in the bone marrow were measured. The mitotic index fell sharply on the 1st day and then rose rapidly to a maximum on the 7th day; a second shallow minimum on the 15th day was then followed by a gradual rise. The number of cells of the bone marrow

Card 1/2

Disturbance of cell regeneration ...

S/241/63/008/002/004/006
D243/D307

was not however fully related to the above changes. Chromosome aberrations rose sharply on the 1st day after irradiation and then rapidly decreased, with a slight maximum on the 7th day. The mitotic activity of erythropoietic cells showed a sharp rise from the 3rd day after dosing, indicating regeneration of these cells. It is concluded that the myeloid cells of the bone marrow, which divided with manifestation of chromosome aberrations, gave rise to non-viable daughter cells and perished rapidly. There are 1 figure and 3 tables.

AUTHOR: Gruzdev, G. P.; Fedotova, M. I.; Shcherbova, Ye. N.

TITLE: Certain regularities in marrow wasting in rats injured by gamma radiation 19

SOURCE: Radiobiologiya, v. 3, no. 3, 1963, 389-392

TOPIC TAGS: marrow wasting, radiation sickness, quantitative marrow cell count

ABSTRACT: Little is known about the wasting process of blood-forming tissue, especially marrow, in radiation sickness. This study differs from others because it uses a quantitative marrow cell count method to measure wasting. White rats were exposed to a cobalt gamma source in doses of 150, 400, 750, and 5,000 r. Dose power was 290-302 r/min. After exposure marrow cell counts at the hip were made at regular intervals from .5 hr to 72 hrs. Results are summarized in Figs. 1 and 2. Marrow wasting, it was found, can be divided into three phases. The first phase lasts 4 hrs and the number of cells does not change. The second phase lasts 2-3 hrs and the number of cells decreases depending on radiation dose (in the range from 400 to 5,000 r the dependence can be expressed by a power function). The third phase has a duration depending on radiation dose and the number of cells also decreases according to the same power function except for the 150 r dose. For

Card 1/2

L 112h1-63
ACCESSION NR: AP3001063

D

small dose radiation (150-400 r) the second phase is most important because 52% to 77% of the total decrease in number of cells takes place. For large dose radiation (750-5,000 r) the second and third phases are of nearly equal importance because decrease in the number of cells is about 51% to 60% in the second phase and 49% to 40% in the third phase. TITLE: The use of type ЭПД-13 (EPD-12) potentiometer for
programmed control of temperature

PERIODICAL: Priborostroyeniye, no. 3, 1963, 20

TEXT: A short description of a photo-transducer which is the follow-up element of the electronic potentiometer type EPD-12. The photo resistive element constitutes one arm of a bridge. For programmed control a diagram, corresponding to the given programme of temperature variation, is inserted in front of the photo resistive pick-up and any unbalance of the bridge resulting from the deviation from the given curve is amplified and applied to the relay controlling the heating element. The above type of electronic potentiometer, with additional switching arrangements, was used successfully for the control of a six-zone electric furnace. There are 3 figures.

TITLE: Testing the End Stuffing Boxes of Electric Drills With the Addition of Molybdenum Bisulfide to the Butting-Ends Lubrication Oil (Ispytaniye tortsovykh sal'nikov elektroborov s dobavkoy dvusernistogo molibdena v masici dlya smazki tortsov)

PERIODICAL: Energeticheskiy Byulleten', 1958, Nr 6, pp 22-24 (USSR)

ABSTRACT: The laboratory of the Vsesoyuznyy nauchno-issledovatel'skiy institut burevoy tekhniki (All-Union Research Institute for Drilling Technology) has carried out test-bed experiments using molybdenum bisulfide as an admixture to the oil for lubricating the butting ends of stuffing boxes for the lower end of the engine shaft of electric prospecting drills. The most satisfactory effect was achieved with a mixture of 30 g MoS₂ per liter of aviation oil. A decrease in oil consumption was observed, particularly with increased pressure drops and the mixture had a good effect on the running-in and functioning of the packing surfaces. After 100 hours of test run, neither the bronze nor the steel butt ends showed any sign of ribbing or tendency to seize-up. There is 1 figure.

TITLE: Effect of hydrogen bonds on the activity of oxidation inhibitors

SOURCE: AN SSSR, Izv. Seriya khimicheskaya, no. 9, 1964, 1583-1590

TOPIC TAGS: hydrogen bond, hydrogen bond formation, oxidation inhibitor, peroxide radical, peroxide radical inhibitor reaction, hydrogen atom rupture

ABSTRACT: The inhibiting action of oxygen-containing compounds on the reactivity between oxidation inhibitors and peroxide radicals was studied. The existence of two types of reactions between peroxide radicals RO_2^{\cdot} and inhibitors (InH) as suggested by Ye. T. Denisov and V. V. Kharitanov (Zh. fiz. khimii 38, 639 (1964)) was confirmed: (1) rupture of the hydrogen atom from the inhibitor:

and (2) reversible addition of the peroxide radical to the inhibitor molecule:

Card 1/3

L 21134-65

ACCESSION NR: AP4045795

The relative constants characterizing both reactions using α -naphthol and α -naphthylamine as inhibitors in media containing alcohols, ketones and hydroperoxides were calculated. The inhibiting action of cyclohexanol and cyclohexanone on the reaction of RO_2^{\cdot} with α -naphthol and of n-butanol, cyclohexanone, and cumyl hydroperoxide on the reaction of RO_2^{\cdot} with α -naphthylamine was quantitatively characterized. The hydrogen bond of the type $\text{ArO-H...O}=\text{H}$ formed between the inhibitor molecule and the alcohol (butanol) hinders rupture of the hydrogen from the inhibitor molecule and thus lowers its reactivity. Similar reduction in reactivity of α -naphthylamine by butanol was noted. The lowered inhibitor activity caused by hydroperoxides was explained due to the formation of an amine-hydroperoxide complex rather than the hydrogen bonding only. The effect of the dielectric constant of the medium was examined: increasing alcohol content from 0-10% raised ϵ only 10% while the inhibitor activity was lowered three times. Thus the lowered reactivity of oxidation inhibitors with RO_2^{\cdot} was attributed largely to the hydrogen bond formation between the oxygen-containing compounds and the inhibitor.

"Study of Water Sources on the Black Sea Coast."

Sofia, Voprosy Meditsinskogo Dela, Vol. 7, No. 4, Dec 1967, pp. 52-57.

Abstract: Chemical analyses and coliform counts of 102 sources of drinking water along a belt reaching 10 to 30 km. inland from the Black Sea coast of Bulgaria. The area is divided into 7 zones. The water in the areas of the cities of Varna, Burgas and Sozopol was generally the best; that in the zone next to the Turkish border was worst from the bacterial standpoint. Discussion of geological strata and various other factors affecting both mineral composition and microbial contents. No references.

"Diagnosis of the Anicteric Forms of Epidemic Hepatitis."
Sofia, Suvremenna Meditsina, Vol 14, No 3, 1963, pp 31-39.

Abstract: /Authors' English summary modified/ The authors observed 80 patients suffering from the anicteric form of epidemic hepatitis, assuming that a very slight subictericus of the sclera should be classified as an anicteric form of the infection. Symptoms such as exhaustion and lack of appetite are important for diagnosis. Darkening of the urine is particularly important, with an increased amount of urobilinogen and often a positive reaction to bilirubin. Hepatomegaly was noted in 92.5 percent of the cases, splenomegaly in 27.5 percent. The Weltmann coagulation band is more often extended in the initial 1/2 stage of the disease than the McLagan test, which

"Cholesterol Content in the Serum and Some Tissues of Thymectomized Rats"

Sofia, Eksperimentalna Meditsina i Morfologiya, Vol 5, No 2, pp 78-82

Abstract: The effect of thymectomy on the cholesterol metabolism of rats was studied. Overloading of the system with cholesterol by means of a special diet did not increase the cholesterol content in the serum of either normal or thymectomized animals. The cholesterol content in the serum was lower in thymectomized than in normal animals. Accumulation of cholesterol in the aorta wall was greater for control animals than in those with an excised thymus. On suppression of thyroid activity by administration of thymidazole, the situation was reversed: the content of cholesterol in the aorta wall was higher in the thymectomized than in the control animals. Table, 19 references (2 USSR, 17 Western). Manuscript received Feb 66. Russian and English summaries.
