TITLE: Effect of stimulated emission on the transmission coefficient of some organic dye/solution

SOURCE: Optika i spektroskopiya, v. 20, no. 5, 1966, 903-905

TOPIC TAGS: ruby laser, stimulated emission, optic transmission, dye chemical, organic cyanate compound

ABSTRACT: Experiments are conducted to determine how much emission power density is required in the resonator of a ruby laser for transillumination of various organic solutions. A block diagram and brief description of the experimental equipment are given. Curves are also given showing the transmission coefficient as a function of incident radiation power for solutions of vanadyl phthalocyanine in dimethyl formamide, kryptocyanine in methanol, vanadyl phthalocyanine in nitrobenzene and zirconium phthalocyanine in  $\alpha$ -bromonaphthalene. These curves show that transmission of the specimens approaches 100% at a power density of the order of several  $Mw/cm^2$  which corresponds to energy densities of  $10^{17}$  quanta/ $cm^2$  in a period of  $10^{-8}$  sec. This indicates that transillumination of specimens in this class is basically due to transi-

ACC NR: AP6015435

tions from ground energy levels to singlet states with lifetimes of the order of  $(2-8) \cdot 10^{-9}$  sec. A reduction in solution concentration (increase in initial transmission) shifts the curve toward lower power densities without changing its shape. In conclusion the authors thank A. N. Terenin and O. D. Dmitriyevskiy for interest in the work. Orig. art. has: 3 figures.

TITLE: Electrical conductivity of phthalocyanines of certain metals

SOURCE: Zhurnal fizicheskoy khimii, v. 40, no. 3, 1966, 741-743

TOPIC TAGS: organic semiconductor, phthalocyanine, electric conductivity

ABSTRACT: The effect of the metal atom on the thermal activation energy for conduction of certain metal-containing phthalocyanines has been studied and the activation energy was correlated with the position of the peak in the long wavelength (320 to 1100  $\mu\text{m}$ ) region of the absorption spectrum. To this end, the temperature dependence of conductivity was measured and absorption spectra were recorded for phthalocyanines of transition metals of groups IV (titanium, zirconium, and hafnium) and VIII (nickel, palladium, and platinum) of the periodic table. Chloro derivatives of the phthalocyanines were used in all cases except that of nickel. Electrical measurements were carried out for pellet samples in vacuum ( $10^{-3}$  mm Hg) at 25 to 230C. It was found that the temperature dependence of conductivity obeyed an exponential law in all

cases. Electrical conductivities varied from  $5 \times 10^{-13}$  to  $2 \times 10^{-10}$  mho/cm and activation energies from 1.35 to 1.60 ev. The activation energy and the energy required for transition of the chlorophthalocyanines changed symbatically and rose with increasing atomic number of the metal. It is suggested that this rise is associated with an increase in the donor-acceptor interaction between the metal atom and nitrogen atoms in the phthalocyanines. The energy of electrons in the conducting state was lower than the energy of the lowest excited state. [SM]

TITLE: Q-switching of ruby laser with help of bleachable filters made of phthalocyanine solutions

SOURCE: Moscow. Universitet. Vestnik. Seriya III. Fizika, astronomiya, no. 4, 1966, 103-105

TOPIC TAGS: ruby laser, laser modulation, passive Q switch, liquid Q switch, metal phthalocyanine

ABSTRACT: The dynamics of development of giant pulses and optimization of parameters of a ruby laser with a bleachable liquid filter, the Q-switching efficiency of the filter as a function of its absorption characteristics, have been studied experimentally. The experimental setup consisted of a 120 mm ruby rod 12 mm in diameter and a cell with a phthalocyanine solution which was placed in the cavity of the laser. The cavity was formed by a mirror with 99% reflection and a plane-parallel glass plate as the exit mirror. The bleaching process was initiated under the effect of fluorescence, then developed under the effect of an ordinary laser pulse which grew into a giant pulse by an avalanche-type mechanism. The coefficient of initial transmission ( $T$ ) of the filter should satisfy the equation  $R_1 T^2 = R_{eff}$ , where  $R_1$  is the transmission (T).

2

reflection coefficient of one of the mirrors (99% in the experiment) and  $R_{eff}$  is the reflection coefficient of the exit mirror. The width of the absorption band of the bleachable solution should be less than 300 Å and the shift of its absorption peak in relation to the pulse emitting wave length should be less than 50 Å for a good Q-switching filter. These conditions were met to an optimum degree in solutions of vanadyl phthalocyanine in nitrobenzene, zirconium phthalocyanine in nitrobenzene and in benzyl alcohol. Giant pulses of 70, 70, and 55 Mw, respectively, were obtained with the above solutions, at 12 kJ pumping energy and  $T = 12\%$ . The output power of the giant pulses was one or two orders of magnitude lower with the solutions of aluminum phthalocyanine chloride in nitrobenzene or ethyl alcohol and zirconium phthalocyanine in toluene or ethyl alcohol. The authors thank S. A. Akhmanova and R. V. Khokhlova for valuable discussion. Orig. art. has: 3 figures and 1 table.

TITLE: Electrical conductivity of polymeric phthalocyanines of certain transition metals

SOURCE: Zhurnal fizicheskoy khimii, v. 40, no. 10, 1966, 2614-2616

TOPIC TAGS: organic semiconductor, semiconducting polymer, polyphthalocyanine

ABSTRACT: Polymeric phthalocyanines of scandium, cobalt, and zirconium have been prepared and their electrical properties have been studied. It is noted that previously electrical properties had been studied only for the polymeric phthalocyanine of copper. The polymers were dark powders insoluble in dimethylformamide and  $\alpha$ -bromonaphthalene, and readily soluble only in concentrated  $H_2SO_4$ . The temperature dependence of conductivity was measured at 20--250°C for pressed pellet samples in a stream of dry argon, and the thermal activation energy for conduction was determined and correlated with the most intense long-wavelength

absorption band in the visible region. It was found that the temperature dependence of conductivity obeys an exponential law. Measurement of the temperature dependence of thermoelectric power showed that the conduction was n-type in the entire temperature range. The conductivity at 293K for the polymers was in the range  $10^{-7}$  to  $10^{-9}$  mho/cm. The activation energy varied from 0.53 to 0.62 ev, values much lower than for the monomers. The activation energy varied symbatically with optical excitation energy. Orig. art. has: 2 tables.

TITLE: Device for the Continuous Measurement of Pressure and Vacuum

PERIODICAL: Tr. Mosk. in-ta khim. mashinostr., 1958, 17, 173 - 178

ABSTRACT: A device for the measurement of pressure and vacuum in processes, proceeding quickly and slowly, was designed and tested by the Moscow Institute of Chemical Machine Construction. The sensitive part of the device is an elastic ring, rigidly fastened to a rod with a diaphragm taking up the pressure. The application of wire pick-ups permits, in addition to the measurement of the process, its continuous recording with the aid of self-recorders or oscilloscopes. By this the pick-ups are switched into the circuit of the bridges. The feed of the pick-ups is effected by an amplifying generator with a frequency of 6,000 cycles. The device is distinguished by an extensive measuring range, its simple design and adjustment. The design excludes the effects of temperature on the indications of the device. 4 circuits.

Title : Distortion of Ultrasonic Waves of Finite Amplitude in Liquids.

Orig Pub : Dokl. AN SSSR, 1956, 109, No 3, 485-488

Abstract : An investigation was made of the behavior of harmonics in a wave of finite amplitude, propagating in a liquid. The quartz radiator operated at a frequency of 1.5 Mc. The receivers were quartz plates with resonant frequencies 1.5, 3, 4.5 Mc. The dependence of the amplitude of the acoustic pressure of the second and third harmonic on the distance to the radiator was obtained graphically for various voltages on the quartz in the following liquid media: tap water, transformer oil, and glycerin. The distortion in the shape of the sound wave and the associated appearance of harmonics in the liquid is made possible by the non-

: The laws that are fulfilled are: (1) The relative increase in absorption  $\alpha/\alpha_c$  is linearly dependent on the sound pressure. (2) For liquids for small values of  $2\omega$ , the ratio  $\alpha/\alpha_c$  is greater than for liquids with large  $2\omega$ . At the same time, there is enough of a quantitative deviation from this theory, and this is explained by losses in the formation of the acoustic flow, and also by possible increase in the relaxation losses in a wave of finite amplitude. Bibliography, 8 titles.

TITLE: Propagation of ultra-sonic waves of finite amplitude in liquids. (O rasprostranenii ultrazvukovykh voln konechnoy amplitudy v zhidkostyakh.) 46-1-4/20

PERIODICAL: "Akusticheskiy Zhurnal" (Journal of Acoustics), 1957,  
Vol. III, No. 1, pp. 29 - 36 (U.S.S.R.)

ABSTRACT: Non-linear properties of liquids have been directly proved by Mikhaylov 1) from the "mixing" effect of two ultra-sonic waves, by Gorelik, A.G. and Zverev, 2), who achieved amplitude and phase modulation of ultra-sonics by sound, by Loeber and Hidemann, 3), who observed by optical method the distortion of standing waves in liquids and by the authors of the present article in one of their earlier works, 4), in which they observed harmonics of a wave with finite amplitude propagated in a liquid. These non-linear properties of liquids govern the wave propagation in liquids. It can be said that the greater the amplitude the greater would be the coefficient of absorption; the fact observed by Sykhenvald, A.A. 5), during experiments to confirm the investigations by Neklepayev, N. of ultra-sound absorption in air. In the present article, results of experimental determination of the absorption coefficient, of a wave with finite amplitude in various liquids, as a function of the sound intensity (with a fundamental of 1.5 Mc/s)

TITLE: A Method of Visualisation of Acoustic Flow on the Interface between Two Immiscible Liquids (Metod vizualizatsii akusticheskogo tocheniya na granitse dvukh neosmislivayushchih sey chidrostey)

PUBLISHER: Akusticheskiy Zhurnal, 1957, Vol.III, No 4, p.573-574  
(USSR)

ABSTRACT: A simple method of visualisation of lines of flow is described. A plastic glass vessel (20 x 20 x 20 cm) was covered with a silencer at one end and half-filled with glycerine and then filled up with vaseline oil. The interface between the two liquids was on the axis of a quartz radiator operating at a frequency of 5 Mc/s. A coloured water drop is put into the vaseline oil and falls through it until it reaches the interface and spreads out to form a thin coloured film. The film moves along the flow lines, and a flow line pattern can be clearly seen and photographed. A diagram showing the pattern as a function of time is shown p. 573. N. A. Mironov and L. I. Sannikov are thanked for their assistance. There is 1 figure.

TITLE: On the Problem of the Propagation Rate of Ultrasonic Waves of Finite Amplitude in a Liquid

PERIODICAL: Akusticheskiy zhurnal, 1960, Vol. 6, No. 1, pp. 47 - 51

TEXT: The authors investigated the propagation rate of the zeros of a wave of finite amplitude in aqueous methyl alcohol solution with a temperature coefficient of velocity amounting to  $\sim 10^5 \text{ grad}^{-1}$ , as well as in water by the phase method. Such points of the sound wave were designated as zeros in the work under review (Fig. 1), whose amplitude is equal to zero, viz. whose state does not differ from the one in the undisturbed medium (the distance between the zeros being equal to  $\lambda$ ). The scheme of the experimental setup is illustrated in Fig. 2. The change in velocity was determined with a maximum accuracy of 0.003%. On a change of the voltage at the quartz from 100 v to 1.5 kv, a considerable rise (of the order of 100 m/sec) was observed in the propagation rate. In this case, the phase change with time occurred discontinuously (Fig. 3). ✓

This rise in velocity arises at a certain section and is probably basically related to secondary cavitation effects. Measurements in a tube under constant overpressure ( $\sim 1$  atmosphere) showed with an accuracy of  $\sim 7 \cdot 10^{-3}\%$  that the propagation rate of the zeros of a wave of finite amplitude of vibration with Reynolds numbers  $\sim 10$  and Mach numbers  $\sim 4 \cdot 10^{-4}$  remains constant. The authors thank V. A. Krasil'nikov, M. A. Isakovich for their useful advice, and Engineer K. L. Gurdin for their assembling and adjusting of the phasometer. AUTHOR: Shklovskaya-Kordi, V. V.

TITLE: An acoustical method for determining internal pressure in liquids

PERIODICAL: Akusticheskiy zhurnal, v. 9, no. 1, 1963, 107 - 111

TEXT: The internal pressure  $\frac{P}{c} = \frac{Q_0 C_0^2}{n}$  of a liquid is determined by measuring the parameter  $n = \frac{P}{C} \chi_1$ , which characterizes the non-linearity of the equation  $P = A \left\{ \left( \frac{Q}{Q_0} \right)^n - 1 \right\}$ , with an arrangement shown in Fig. 1. The method is based on the fact that distortion of finite amplitude waves depend on n:  $P_2 = \frac{n+1}{4} \left( P_1 \frac{K \omega}{Q_0 C_0} \right)$ , where  $P_1$  and  $P_2$  are the pressure amplitudes of

the first and second harmonic. n may be determined from measurements of the absolute pressures  $p_1$  and  $p_2$ . In the work described in the present paper, measurements were carried out in distilled water; in other liquids

TITLE: Contribution to the theory of second sound in semiconductors

SOURCE: Fizika tverdogo tela, v. 8, no. 10, 1966, 3050-3055

TOPIC TAGS: semiconductor theory, semiconductor carrier, carrier density, crystal defect, phonon scattering, sound wave, semiconductor research, phonon

ABSTRACT: The authors consider second sound produced in semiconductors not by all the phonons, as in earlier investigations, and not in the presence of an external electric field, but by longitudinal phonons only in the absence of an electric field. It is shown that for second sound to be produced under these conditions it is necessary that the temperature be much lower than the Debye temperature (less than one-tenth of the latter), that the carriers not interact with optical phonons, that the semiconductor be sufficiently pure to minimize scattering of the phonons by defects, and that the electron and hole concentrations must be sufficiently large and close to each other. The frequencies at which second sound is realizable range from  $10^6$  to  $10^8$  cps. At the

Card 1/2

ACC NR: AP6033569

indicated low temperatures, a high carrier density can be produced by illumination. The dissipation in the phonon-carrier interaction is estimated and it is shown that at high carrier density the second sound is weakly damped. An experiment capable of disclosing the presence of second sound in semiconductors is suggested. Orig. art. has: 1 figure and 9 formulas.

"Astron Zhur" Vol XXVI, No 1

30/49T89

A monochromatic radio-emanation of frequency 1,421.3 megacycles ( $\lambda = 21$  cm) occurs in the transitions between components of superfine structure of basic state of interstellar hydrogen atoms. Calculated probability of transition to be  $0.72 \times 10^{-15}$  sec $^{-1}$ . Determines half-width of this emanation line by Doppler effect.  $\Delta \nu_D = 4 \times 10^{-4}$  sec $^{-1}$ . Optical thickness of interstellar hydrogen for this monochromatic radio-emanation is small. Intensity of the line  $\lambda = 21$  cm is tens of times greater than intensity of the continuous radiospectrum band of the Galaxy and its width is  $2 \Delta \nu_D$ . Investigates possibilities of detecting this emanation experimentally. Shows that, with radio apparatus of present-day sensitivity, this emanation will be detected if the "gain" of the antenna is over 65, which is attainable. Shows that monochromatic radio-emanation is not to be expected from other interstellar atoms. The molecules CH, CH+, OH can give monochromatic emanation (for OH,  $\lambda = 9.54$  cm) occurring in transitions between components of the  $\Delta$ -duplicate of the basic rotary states. This emanation can be detected. Studying distribution of monochromatic radio-emanation intensity in the sky gives extremely important data on physical state of interstellar gas.

7471. Computation of the concentration of the coronal ions in ground quantum states. L. S. SHKLOVSKY. *Ann. Crimean Astrophys. Obs.*, 5 (1950) English Abstr. in *Astron. News Lett. [Harvard]* (No. 56) (June 20, 1951) *In Russian*

It appears that, if within the inner corona the excitation is produced by electron collisions, then in the outer corona the dominant part in the excitation of the green and red lines belongs to the radiation of the photosphere. The author then gives a theory of the relative intensities of different coronal lines belonging to one and the same ion (Be XII, Ni XV, Fe XI, Ni XIII). It is shown that the lines  $\lambda\lambda 3694$  and  $5446$  cannot belong to Ca XV. It is suggested that the regions of radiation of  $\lambda\lambda 3694$  in the corona are relatively cool. It is possible that the line  $5694$  is caused by some transition of Ne VI

Identification of the infrared radiation of the nocturnal sky with the vibration-rotation bands of the hydroxyl molecule. I. S. Shklyovskii (Crimea Astrophys. Observatory) *Nauk. Akad. Nauk S.S.R.* 75, 371-4 (1952). - The spectrum observed, in the range 9000-11,000 Å., by Krasovskii (*ibid.* 66, 53-4 (1949); 70, 990-1000 (1950); 73, No. 4 (1950)), and shown, in contradiction to Stebbins, *et al.* (C.A. 39, 2030<sup>1</sup>) not to be attributable to the 1st pos. system of  $N_2$ , is identified completely with the vibration-rotation spectrum of OH, with the use of Sponer's formula  $\nu = 3734.9 (r' + \frac{1}{2}) - 82.0 (r' + \frac{1}{2})^2$ , applied to  $r' = 0.9$ , and the known formulas and data for the rotational structure. Absence of emission at 8700 Å., i.e. absence of the band (10, 6), shows that there are no OH in vibrational states higher than the 10th. The whole spectrum in the range 7200-8500 Å. can be identified with the OH bands (8, 3)-7250-7400 Å.; (4, 0) 7470-7600; (9, 4) 7700-7830; (5, 1)-7850-8070; (6, 2) 8280-8500 Å.; only the latter was identified by Meinel (C.A. 44, 6263a, 9244). The weak band at 8650 Å. does not belong to OH, and may, in agreement with M., be due to  $O_3$ . In the (7, 3) band beginning at 8770 Å., only the R and Q branches can be seen. In the range 8800-11,000 Å., the exptl. spectrum of Krasovskii, which, around 8800 Å., overlaps with that of M., can also be completely identified with the OH bands (7, 3), (8, 4) 9100 Å., (3, 0) R 9700, (3, 0) P and (9, 5) R 9950, (3, 1) R and (9, 5) P 10,374, (4, 1) Q and P 10,300, (5, 2) 10,800. - N. Thon

(Quantitative Analysis of the Intensity of Hydroxyl Radiation of the Night Sky).  
Akademiya Nauk SSSR. Doklady, 1950, v. 75, no. 6, p. 789-792, tables, 7 refs.

AS262.S3663 v. 75

The absence of an emission of  $\lambda = 6270\text{\AA}$ . indicates that the hydroxyls of the earth's atmosphere are excited only the the 9th vibration level and that the formation of the excited hydroxyls occurs according to the equation  $\text{H} + \text{O}_2 \rightleftharpoons \text{OH} + \text{O}_2$ . With the aid of a formula developed by Scholz, the intensity of the OH vibration-rotation spectra was calcd. The results agreed well, especially with the strong intensity of the OH emission of the nocturnal sky in the far infrared.

USSR/Astronomy - Night sky, Infrared

"Nature of Infrared Radiation of Night Sky," I. S.  
Shklovskiy

"Iz Krymskoy Astrofiz Observ" Vol 7, pp 34-58

Powerful infrared radiation of night sky within the range of 9,000-11,000 Å is identified with the rotational-oscillatory spectrum of hydroxyl mol. Mol. consts by H. Sporer ("Molekulspektren und ihre Anwendung auf chemische Probleme," 1935) are applied for identification. Probabilities of transition lines of OH are computed using quantum mechanics

formulas by K. Scholz (Zs f. Phys. 78, 751, 1932). Spectrum is extrapolated to unobservable 44,500 Å and the intensity of this line is found to exceed by 2,000 times that of the familiar green line. Altitude of glowing is assumed to be below 100 km.

Ob izluchenii vodorodnykh liniy v spektrakh polyarnykh siyaniy (Emission of Hydrogen Lines in the Spectra of Aurorae Boreales). Akademiya Nauk SSSR. Doklady, 1951, v. 81, no. 3, p. 367-370, 7 refs.

AS262.S3663 v. 81

Protons of solar origin yield neutral H atoms which are excited by collisions with atoms and molecules of the terrestrial atmosphere. The peculiarities of the elastic and non-elastic collisions of H atoms endowed with a velocity of c. 1000 km/sec can account for the penetration of these atoms to the height of 115-120 km (the usual level of polar lights.). Contours of the  $H_{\alpha}$  line observed in the spectrum of polar lights can be explained by assuming that corpuscles penetrating into the atmosphere have a broad velocity spectrum. The concentration of H atoms of solar origin is estimated at  $[H] = 0.6 \text{ cm}^{-3}$  from the formula

$$I = \frac{h\nu}{4\pi} \int_{S_0}^{\infty} [H][N]\sigma dS = \frac{h\nu}{4\pi} [H] V\sigma \int_{S_0}^{\infty} [N] dS$$

where  $\sigma$  - the effective cross-section of excitation by collision with the atmospheric molecules,  $V$  - velocity of H atoms (1000 km/sec),  $I$  - intensity of  $H_{\alpha}$  ( $3 \times 10^{-4} \text{ erg/cm}^2 \text{ sec}^{-1} \text{ steradian}$ ),  $S_0$  lower limit of polar lights altitude (115 km), and  $(N)$  - the concentration of molecules in the atmosphere.

Galaxy

Mar/Apr 52

"Radiospectroscopy of the Galaxy," I.S. Shklovsky, State Astr Inst imeni Shterberga

"Astron Zhur" Vol XXIX, No 2, pp 144-153

Exponds theory of monochromatic radio-wave radiation of the Galaxy taking into consideration the observed exceptionally low kinetic temp of interstellar gas in the HI zones. Total number of hydrogen atoms in a column of unit cross section through the entire Galaxy is about  $10^{23}$ /sq cm, which suggests that the mass of interstellar gas

SHKLOVSKY, I. S.

is only a small percent of total mass of Galaxy. Suggests the exceptional possibility of investigating the isotopic compn of interstellar gas by absorption line of deuterium and hydrogen. Submitted 30 Nov 51.

Jul/Aug 52

"Nature of Radio Emission From the Galaxy," I. S.  
Shklovskiy, State Astr Inst imeni Shternberg

"Astron Zhur" Vol 29, No 4, pp 418-449

Discredits Unsöld's theory (cf. A. Unsöld, Naturwiss. 33, 37, 1945; ibid. Zs. f. Ap. 26, 1949) on negligibly small effect of interstellar ionized gas on the observed radio emission of the Galaxy. States that the radio emission of the Galaxy has 2 components of different nature: "gaseous" and

226T43

"radiostellar." The 1st predominates on short waves; the 2d, on long waves. Besides "usual" radio stars, the article notes, a group of unique objects with intense radio emission exist and are probably bound to some Galactic cosmic bodies.

Received 21 Apr 52.
