Capacity for auto-activation of pancreatic juice obtained in response to different foods. G. K. Shligin (*J. Physiol., USSR*, 1951, 37, 338-342).—Pancreatic juice was collected from a fistula in a dog, and tested for its capacity for auto-activation of its trypic activity on maintenance at 37°. The juice secreted in response to fat possesses this in high degree, for the first 24 hr. it has no trypic activity, within 48 hr. this is present and increases up to 72 hr. Simultaneously the capacity for activation by enterokinase decreases, indicating a destruction of trypsinogen. Capacity for auto-activation varies according to the previous diet. The juice secreted in response to bread or meat has never any significant capacity for auto-activation.

TITLE: Radiative inter-impurity recombination in germanium

SOURCE: Fizika tverdogo tela, v. 8, no. 7, 1966, 2124-2129

TOPIC TAGS: germanium, photoconductivity, impurity center, recombination radiation, low temperature research, phonon

ABSTRACT: This is a continuation of earlier investigations of the photoconductivity of germanium at helium temperatures and at sufficiently large concentration of shallow impurities (jump photoconductivity) (FTT v. 6, 1203, 1964), where it was shown that the main recombination process under these conditions is inter-impurity recombination. The present investigation is an attempt to confirm the presence of inter-impurity transitions in germanium by direct observation of the radiation connected with such transitions. The particular transitions considered were arsenic - gallium and antimony - gallium in germanium at 2K. The arsenic and gallium impurities were produced by irradiating the original germanium in a reactor. The original germanium contained various amounts of antimony. The sample was excited with continuous white

Card 1/2

3

light and the investigated recombination radiation was registered at instants between the excitation pulses. A monochromator and a photoresistor were used to analyze the radiation. The gallium-arsenic<sup>75</sup>/recombination spectrum contains two lines corresponding to phononless transitions and to transmission with emission of a single longitudinal acoustic phonon. The antimony-gallium transition spectrum corresponds to transition spectrum spectrum corresponds to transitions with emission of a longitudinal acoustic phonon. It is concluded that the presence of inter-impurity recombination in germanium is confirmed by the present experiments both as a whole, and in its details which involve the nonequilibrium distribution of impurities and the dependence of the recombination probability on the distances between them. TITLE: Gamma Radiolysis of n-Heptane Adsorbed on Oxide Catalysts

PERICDICAL: Doklady Akademii nauk SSSR, 1961, Vol. 136, No. 1, pp.147-150

TEXT: The purpose of the present work was investigation of the particular features of radiolysis of adsorbed n-alkanes with n-heptane whose homogeneous radiolysis had already been thoroughly investigated (Refs. 1 - 3). Gamma radiolysis the method of which had already been described (Refs. 6, 7) was performed by means of the following catalysts. I: Pure  $\text{Al}_2\text{O}_3$ ;

II: aluminum-chromium catalyst, promoted with potassium oxide, 90 %  $\text{Al}_2\text{O}_3$ , 8 %  $\text{Cr}_2\text{O}_3$ , 2 %  $\text{K}_2\text{O}$ ; III: aluminum-molybdenum catalyst, 87 %  $\text{Al}_2\text{O}_3$ , 10 %  $\text{MoO}_3$ , 3 % basic sulfates; IV: cobalt-aluminum-molybdenum catalyst, 79 %  $\text{Al}_2\text{O}_3$ , 15.5 %  $\text{MoO}_3$ , 5.5 %  $\text{CoO}$ . Radiolysis at catalyst II was investigated in the case of rare surface occupation ( $\theta \ll 1$ ) as well as in

Card 1/5

B004/B056

the case of adsorption of several molecular layers. The other catalysts were investigated with monomolecular surface coating ( $\theta = 1$ ). Temperature during the experiment was about  $10^{\circ}\text{C}$  in which case heptane adsorption is reversible and chemisorption does not occur. Fig. 1 shows for catalyst II the increase  $\Delta P$  in gas pressure with respect to 1 g heptane as depending on  $\beta$ , which stands for the ratio of the electron fractions catalyst/heptane. The break in the curve corresponds to the appearance of monomolecular coating; this permits to determine the specific surface of catalysts by means of this curve. If for homogeneous radiolysis  $\Delta P$  is set equal to unity then the following values of  $P_{\text{rel}}$  resulted for the catalysts. Catalyst I:

12.7; catalyst II: 2.0; catalyst III: 1.7; catalyst IV: 3.6. The linear dependence of  $\Delta P$  on  $\beta$  in the case of monomolecular covering proves that energy transfer takes place only in the monomolecular layer. Rate of radiolysis for the layers above is equal to the rate of the homogeneous process. From a paper of the authors (Ref. 6) on epr spectra of catalyst systems it is concluded that the most active catalyst is the one whose epr spectrum during irradiation in the presence of the hydrocarbon changes the least with respect to the spectrum of the irradiated pure catalyst.

B004/B056

The  $\Delta P = f(t)$  curve taken by an EPP-09 (EPP-09) recorder is not linear in its first section which is attributed to impurities. The latter also are assumed to be responsible that previously irradiated catalysts were considerably less active. The probability of energy transfer from the catalyst to adsorbed substance is estimated on the basis of the following processes.

- 1)  $X_{ads} \rightarrow X^*$  (direct absorption of radiation by adsorbed substance);
  - 2)  $X^* \rightarrow X$  (deactivation processes, except chemical reactions);
  - 3)  $X^* \rightarrow$  products of chemical reactions;
  - 4) catalyst  $\rightleftharpoons$  catalyst';
  - 5) catalyst'  $\rightarrow$  catalyst;
  - 6) catalyst' +  $X_{ads} \rightarrow$  catalyst +  $X_{ads}^*$ .
- The rates of these processes are:  $w_1 = k_1 I \theta$ ;  $w_2 = k_2 [X^*]$ ;  $w_3 = k_3 [X^*]$ ;  $w_4 = k_4 I$ ;  $w_5 = k_5 [D]$ ;  $w_6 = k_6 [D] \theta$ .  $[D]$  denotes the concentration of elementary excitations in the solid,  $I$  - radiative intensity. The following is deduced:  
 $w_3 = k_3 I \theta / (k_2 + k_3) [k_1 + k_4 k_6 / (k_5 + k_6 \theta)]$  and for homogeneous radiolysis:  
 $w'_3 = k_1 k_3 I / (k_2 + k_3)$ . In the case of  $\theta = 1$ ,  $w_3/w'_3 = 1 + 1/(\epsilon k_1/k_4)(k_5/k_6 + 1)$  holds, where  $\epsilon$  stands for the ratio of absorbed radiation energy per 1 cm<sup>3</sup>

Card 3/5

B004/B056

heptane and catalyst.  $w_3/w'_3$  was determined experimentally;  $\epsilon$  was calculated according to Ref. 12,  $k_1/k_4 \approx 1$ . From these data the authors estimated the probability Z of total energy transfer:  $Z = k_6/(k_5 + k_6)$ . The values of Z for the respective catalysts are: I: 0.41, II: 0.032, III: 0.026, IV: 0.073. L. V. Pisarzhevskiy and A. I. Kitaygorodskiy are mentioned in the paper. The authors thank V. V. Shchekin and A. L. Klyachko for their collaboration, and Yu. L. Khait for his discussion. There are 2 figures, 2 tables, and 12 references: 6 Soviet, 4 US, and 1 Polish.

TITLE: A study of the radiolysis of hydrocarbons adsorbed on oxide hydrocarbons

SOURCE: Trudy II Vsesoyuznogo soveshchaniya po radiatsionnoy khimi. Ed. by L. S. Polak. Moscow, Izd-vo AN SSSR, 1962, 317-321

TEXT: The radiolysis kinetics of n-heptane were studied, on oxide catalysts ( $\text{Al}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3/\text{Cr}_2\text{O}_3$  activated with  $\text{K}_2\text{O}$ , Al-Mo oxides and Co-Al-Mo oxides), under x ray irradiation; the degree of catalyst coverage ( $\theta$ ) being 0.6, 1.0 or  $>1$  (multilayer adsorption) for the  $\text{Al}_2\text{O}_3-\text{Cr}_2\text{O}_3$  catalyst, and with  $\theta = 1$  in all other cases. The pressure was recorded continuously and its rate of increase rose linearly (for the  $\text{Cr}_2\text{O}_3/\text{Al}_2\text{O}_3$  catalyst) with increasing ratio of the electron fractions of catalyst/heptane, to a maximum (corresponding to the completion of a monolayer), followed by a linear decrease, ✓

A study of the ...

showing that the energy absorbed by the catalyst is transmitted solely into the monolayer. The relative rates of radiolysis,  $\Delta p_{rel}$ , ranged from 1.7 to 12.7 ( $\Delta p = 1$  in the absence of catalyst), being lower for previously irradiated catalysts.  $Al_2O_3$  was most effective. From these and previous results (DAN SSSR, 129, 145 (1959)) it appears that the lesser the difference between the EPR spectra of irradiated (and covered with a monolayer) and pure catalysts, the more effective the catalyst. It is believed that the adsorption is under these conditions intermediate between physical and chemical types. The following sequence of events is envisaged: (1) absorption of energy by the directly adsorbed compound, (2) deactivation processes (other than chemical reaction), (3) chemical reaction processes (other than chemical reaction), (5) energy loss processes within the catalyst, and (6) transfer of energy from the catalyst to the adsorbed hydrocarbons; the corresponding rate constants are denoted by  $k_1, \dots, k_6$ . The probability of step (6),  $Z$ ,

is shown to be  $\frac{k_6}{k_5+k_6}$ , and is linearly related to  $\Delta p_{rel}$ . The rela-

and Protracted Trachoma with the newest Soviet Antibiotics

Orig Pub : Sb. inform.-method. materialov. Gos. n.-i in-t glaznykh  
bolyeznei, 1956, No 4, 111-113

Abstract : Patients suffereing from obstinate and protracted forms of  
Trachoma were treated at the end with sintomycin (1) (231 patients),  
biomycin (11) and terramycin (111) (256 patients).  
Simultaneously the following methods were used: 1. The ap-  
plication of an emulsion of 1 with subconjunctive injections  
of a 0.3% of its solution; 2. Internal administration of 1  
in combination with an application of a 1% emulsion or subcon-  
junctive administration of a 0.3% solution of 1; 3. The  
application of a 1% and 10% emulsion of 11 or a 0.5% and 1%  
emulsion of 111; 4. The cross-application of a 1% emulsion  
of 1 and 11, 11 and 111. Best results were obtained from

TITLE: The problem of the polymerizing action of electric barrier discharge  
PERIODICAL: Akademiya nauk Azerbaydzhanskoy SSR. Doklady, v. 18, no. 10, 1962, 15-19  
TEXT: The nature of barrier discharge (discharge between two dielectric barriers) is described in brief. Assuming the polymerizing action of such discharge to be due to the fission of molecules in the zone of micro-spark discharges into reactive free atoms and radicals, an attempt is made to obtain an approximate expression describing the rates of such polymerizations. Inelastic collisions in the discharge zone may lead to excitation and dissociation, and to ionization. It is proposed that the formation of free radicals is mainly governed by monomolecular dissociations, bimolecular collisions, ionization by electron impacts and photoionization.

The radicals are also taken as forming by a chain process. A general expression is given for the rate of radical formation, from which an equation is derived which allows a calculation of free radical concentration, [R], in terms of velocity constants for the various processes,  $k_i$ , concentrations of starting, intermediate, and final products,  $[M_i]$ , the number of photons emanating from the discharge and absorbed by the reactants, P, and the number of electrons with energy sufficient to ionize the molecules, N. Evaluation and the physical meaning of these factors are discussed, and the overall rate of polymerization,  $V_p$ , is shown to be

$$V_p = \left\{ k_1 [M]^2 + k_2 [M] - k_3 [N][R] + k_4 [M_3]^2 + k_5 [M_3] - k_6 [M_3][R] + k_7 P[M] + k_8 P[M_3] + k_9 [N][M] + k_{10} [N][M_3] \right\}^{\frac{1}{2}} \frac{k_p}{k_0^{\frac{1}{2}}} [M]$$

TITLE: Computer for calculating power-system economy operation and the  
operating experience gained at ODU YeES

SOURCE: Elektrichestvo, no. 3, 1964, 8-12

TOPIC TAGS: power system, Soviet united power system, power system  
economics, power system economics computer, computer, interconnected  
power systems, high economy power system operation

ABSTRACT: An analog computer intended for calculating the high-economy  
operation of the Soviet United Power System (UPS) is described. The following  
features were taken into account in designing the computer: (1) The UPS is  
represented by an equivalent network in which all generating stations of a local  
power system are replaced by an equivalent station having an equivalent incre-  
mental economy rate characteristic; (2) Easy setting of any incremental  
characteristic; (3) System loads are represented by equivalent loads that have

Card 1/2

ACCESSION NR: AP4019325

individual load curves; (4) Interconnection-line losses are evaluated by special methods. The computer comprises the following essential parts: 16 generating station equivalents, 16 loads, 15 tie lines, 8 nonlinear units representing incremental losses due to power exchanges and tie-line load restrictions, 14 elements for setting the resistances of transmission lines. The computer includes 128 UPT-4 amplifiers, 1,000 6D6A diodes, 800 SP-2-A potentiometers, 2,000 resistors, 7 power-supply packs, etc.; power consumption is 7 kw. Computation of a set of operating UPS conditions takes about 2 hrs. The computer has been in continuous use since Nov. '62. "L. B. Denisevich (ODU YeES) and N. S. Malishevskaya (VNIIE) took part in aligning and operating the computer." Orig. art. has: 3 figures and 1 table.

TITLE: Results of testing centrifugal-pump stages having different flow swirls at the impeller inlet

SOURCE: Energomashinostroyeniye, no. 11, 1964, 14-17

10 -

TOPIC TAGS: centrifugal pump, pump inlet flow

ABSTRACT: The results are reported of testing a model centrifugal pump whose entrance flow was twisted by a stationary 12-blade radial set with adjustable blading. Stage characteristics were measured at  $0^\circ$ ,  $\pm 15^\circ$ ,  $\pm 30^\circ$ , and  $\pm 45^\circ$  of the blade turn; data obtained from seven variants of impellers and guide sets is tabulated. Extensive conclusions are offered covering the hydraulic efficiency as a function of vortex, total efficiency, head ratio, rate-of-flow, swirl angles, use of stationary blading, etc. The article offers a new method for determining the

TITLE: On the stability (with respect to periodic disturbances) of a rotating fluid, heated from below

PERIODICAL: Prikladnaya matematika i mekhanika, v. 26, no. 2, 1962  
267 - 272

TEXT: The effect of rotation on the stability of a fluid, heated from below, is considered. The fluid occupies a closed cubic container. The stability is investigated in a coordinate-system which rotates together with the container walls. Terms due to centrifugal and Coriolis forces, are added to the ordinary convection equations; (only terms, linear in the disturbances, are retained). The equations of motion and of heat-conduction are

$$\dot{v} = -\nabla f + \gamma v^2 v + \alpha g \gamma T + 2\Omega(v \times \gamma) \quad \dot{T} = A\gamma v + \chi \nabla^2 T, \quad \nabla v = 0. \quad (1.5)$$

By introducing characteristic units  $l$ ,  $v_1$ , and  $T_1$ , one obtains:

$$\dot{v} = -\nabla f + \nabla^2 v + C\gamma T + D(v \times \gamma) \quad \dot{T} = C\gamma v + \nabla^2 T, \quad \nabla v = 0 \quad (1.7)$$

Card 1/5.

S/040/62/026/002/007/025  
D299/D301

On the stability (with respect to ...)

where P is the Prandtl number, C - the Rayleigh number and D - the Taylor number. The linear equations (1.7) do not contain t explicitly. Hence, all the quantities can be assumed as proportional to  $\exp(\lambda t)$ , and the boundary-value problem

$$\lambda v = - \nabla^2 f + \nabla^2 v + C\gamma T + D(v \times \gamma) \quad \lambda PT = C\gamma v + \gamma^2 T, \quad \nabla v = 0 \quad (1.8)$$

is considered, together with the boundary conditions on the container walls. The equilibrium is stable if  $\text{Re } \lambda$  is negative. The boundary conditions on the faces of the cube are

$$\frac{\partial^2 v}{\partial z^2} = 0 \quad \text{at the upper- and lower faces} \quad (2.1)$$

$$v_n = \frac{\partial v}{\partial n} = \frac{\partial T}{\partial n} = 0 \quad \text{at the lateral faces.}$$

Although these conditions are somewhat artificial, yet they yield results which are qualitatively correct. The convection currents which are formed in the container have simple periodicity with respect to all the coordinates. In order to find the allowed values

Card 2/5

S/040/62/026/002/007/025

D299/D301

On the stability (with respect to ...)

of  $\lambda$ , one applies the operation rot. to the first equation (1.8). After transformations, one obtains for the velocity- and temperature amplitudes a system of 3 homogeneous algebraic equations; by setting the determinant of this system equal to zero, one obtains the equation for the eigenvalues  $\lambda$  of boundary-value problem (1.8). The stability of the largest-possible motion in the cube, is investigated in more detail. The notations

$$u = \cdot / 3z^2, \quad r = 2C^2/27z^4, \quad \tau = D^2/27z^4 \quad (3.1)$$

are introduced. For  $\mu$  one obtains the equation:

$$\alpha\mu^3 + \beta\mu^2 + \gamma\mu + \delta = 0 \quad (3.2)$$

where  $\alpha = P$ ,  $\beta = 2P + 1$ ,  $\gamma = 2 + P + Pt - r$ ,  $\delta = 1 + \tau - r$ . (3.3)

The roots of Eq. (3.2) coincide (to within a factor  $3z^2$ ), with the eigenvalue of (1.8). Therefore, onset of instability coincides with the appearance of solutions to (3.2) with the real part of  $\mu$  equal to zero; as the arising convection currents may be either stationary or nonstationary, the sought solutions can be either time independent (i.e. the imaginary part of  $\mu$  is also zero), or periodic

f

Card 3/5

S/040/52/026/002/007/025  
On the stability (with respect to ... D299/D301

(Im  $u \neq 0$ ). The necessary condition for the existence of periodic solutions is  $P = 1$ . This condition is satisfied by liquid metals. In the following, it is assumed that the condition is fulfilled. It was found that out of the 3 roots of Eq. (3.2), one is always negative. A table shows the values of the other 2 roots in each of 5 regions (shown in a figure). The stability of the liquid in these regions, is discussed. In addition to the largest-possible motion, considered so far, values of the parameters for all the possible motions are tabulated. It is shown that the effect of a magnetic field on stability of motion in a conducting fluid, is fully equivalent to that of rotation; (i.e. the above results apply also to a conducting fluid placed in a magnetic field). There are 1 figure, 2 tables and 8 references: 4 Soviet-bloc and 4 non-Soviet-bloc. The references to the English-language publications read as follows:

AUTHOR: Shliomis, M. I. (Ivanovo)TITLE: Oscillating perturbations in a conductive fluid influenced by a magnetic fieldSOURCE: Prikladnaya matematika i mekhanika, v. 27, no. 3, 1963, 523-531

TOPIC TAGS: oscillating perturbation , magnetic field

ABSTRACT: The author studies, in general forms, the effect of a homogeneous magnetic field on the character of decay of small perturbations from equilibrium of a conductive fluid in a cavity of any form. He shows that for small Hartman numbers  $M$  there are two types of normal perturbations: "magnetic" and "hydrodynamic." Perturbations of both types decay monotonically. The higher of some critical  $M = M_*$  in the spectrum of normal perturbations are such that they can be attributed neither to magnetic nor hydrodynamic; he does not express this type. These normal perturbations oscillate with time, and for  $M$  a little larger than  $M_*$  their frequencies are proportional to  $(M - M_*)^{1/2}$ . The origin

86  
85

Card 1/2

L 18593-63

ACCESSION NR: AP3003246

of the critical point must be connected with the presence of the two types of perturbations for small  $M_0$ . The author studies in detail the character of the exceptions which have perturbations at the same point. He expresses his gratitude to V. S. Sorokin. Orig. art. has: 62 formulas.

TITLE: On perturbations from equilibrium in conducting fluid filling a spherical cavity in the presence of a magnetic field

SOURCE: Zhurnal prikladnoy mehaniki i tekhnicheskoy fiziki, no. 4, 1964, 23-28

TOPIC TAGS: magnetic field, equilibrium condition, perturbation, Hartman number, hydromagnetic wave, hydrodynamic theory

ABSTRACT: The effect of small perturbations on a conducting fluid with viscosity  $\eta$  and electric conductivity  $\sigma$  filling a cavity with immovable walls and in the presence of a magnetic field  $H$  was studied analytically. The equations describing the velocity and field perturbations  $u$  and  $h$ , proportional to  $e^{-\lambda t}$ , are given by

$$-\lambda u = \nabla^2 u + M (\gamma \nabla) h - \nabla p, \quad \operatorname{div} u = 0,$$

$$-\lambda N h = \nabla^2 h + M (\gamma \nabla) u, \quad \operatorname{div} h = 0$$

$$\left( N = \frac{4\pi\sigma v}{c^2}, \quad M = \frac{HR}{c} \left( \frac{\sigma}{\rho v} \right)^{1/2} \right)$$

TITLE: One rigorous solution of the equations for nonstationary convection

SOURCE: Prikladnaya matematika i mekhanika, v. 28, no. 5, 1964, 959-962

TOPIC TAGS: nonstationary heat convection, rigorous solution, convection equation, magneto hydrodynamics

ABSTRACT: In a gravitational field, a fluid of nonuniformly distributed temperature can be in equilibrium only if the temperature gradient is vertical. By heating the fluid from below, the perturbations are either monotonically decreasing, or increasing, so that the equilibrium may be stable, or unstable. By heating from the top, all perturbations decay. A similar situation occurs in the case of the perturbation spectrum of a conducting fluid in a magnetic field (M. I. Shliomis, Oscillating perturbations in a conducting fluid in a magnetic field, PMM, 1963, v. 27, #3). Therefore, the results of that paper are valid in the present case. The rigorous solution is obtained for the case of a fluid in a spherical cavity. The

TITLE: Hydrodynamics of a fluid with intrinsic rotation

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 51, no. 1, 1966, 258-  
265TOPIC TAGS: hydrodynamics, stress tensor, viscosity, shear viscosity, VORTEX FLOW,  
superfluidity

ABSTRACT: A complete set of hydrodynamic equations is derived phenomenologically from the conservation laws for a fluid with an intrinsic angular momentum. The total angular momentum per unit volume of such a medium consists of the ordinary momentum due to hydrodynamic (translational) motion of the fluid and of its proper (intrinsic) rotation  $M$ . In comparison with ordinary hydrodynamics equations, this set of equations contains two additional kinetic coefficients (intrinsic angular momentum diffusion and rotational viscosity coefficients) and an equation for the rate of change of  $M$ . It follows from the latter equation that variation of  $M$  is due to two causes: the absence of equilibrium coupling between the intrinsic angular momentum and vortex motion of the fluid (relaxation) and inhomogeneity of  $M$  (diffusion). The stress tensor is nonsymmetrical. It is shown that interaction

PERIODICAL: Standartizatsiya, 1958, Nr 3, pp 61-63 (USSR)

ABSTRACT: The problem of the fundamental principles of a basic main  
standard for electric measuring and indicating instruments was  
discussed at the first scientific-technical conference on pro-  
blems of electric instruments in 1957, in Leningrad. The Vse-  
soyuznyy nauchno-issledovatel'skiy institut elektroizmeritel'nykh  
priborov Gosplan SSSR (VNIIEP) (The All-Union Scientific  
Research Institute of Electric Measuring Instruments at the  
Gosplan USSR) at present is working out a standard of general  
technical specifications for all indicator-electro-measuring  
instruments. This standard may become a base for complete stan-

dardization of such instruments. It is expected that in the future, when a standard has been worked out, the other single standards will serve as complements to it and will contain only specific data for special types of instruments. The authors make practical suggestions on details of the main standard and criticize the draft of the project, which has been completed by VNIIIEP and sent to the organizations concerned for discussion.

TITLE: Zero Indicator for Measuring Installations of Direct Current

PERIODICAL: Izmeritel'naya Tekhnika, 1959, Nr 5, pp 41-44 (USSR)

ABSTRACT: The authors state, that with bridge or potentiometer-measuring installations of direct current, it is difficult to find a zero indicator (galvanometer) with a suitable sensitivity for current and voltage. For this reason, the use of an installation is recommended, which consists of a condenser, a galvanometer and a commutator (Fig.1). In a bridge scheme, for example, this installation works in the following way: Voltage  $U_{xx}$  moves through Commutator  $P_1$  to condenser  $C$ , which is loaded at the equilibrium of the bridge. Then the condenser is switched off from the zero diagonal bridge by the commutator and unloads to galvanometer  $G$ . The movable part of the galvanometer deviates under the impulse of the unloading current. There are 1 diagram, 1 layout, 12 equations and 3 references, 1 of which is Soviet and 2 English.

TITLE: An Apparatus Used to Analyze Instruments for the Effect of  
Outer Magnetic Fields  
PERIODICAL: Izmeritel'naya tekhnika, 1960, No. 6, pp. 35-39

TEXT: In Soviet and other specifications it is recommended to use a single coil for generating outer magnetic fields while testing electrical measuring instruments (Refs. 1-3). In the practice, however, a double coil (the Helmholtz coil) is usually applied for this purpose. In connection therewith the author gives a theoretical explanation of the use of this double coil. It is shown that when the unsteadiness of the field in the space occupied by the device instrument to be tested varies but little, the mean radius of the ring of the double coil is half as great as the mean radius of the single coil. The conclusions drawn therefrom are explained. Next, a comparison is made between the double coil and a single coil for a ratio of 1:2 between the two radii. A theoretical study has shown that it is more
