PHASE I BOOK EXPLOITATION SOV/1923

Akademiya nauk SSSR. Otdeleniye geologo-geograficheskikh nauk.
Komissiya po probleme "Zakonmernosti razmeshcheniya poleznykh
iskopayemykh."

Zakonmernosti razmeshcheniya poleznykh iskopayemykh (Regularities in
the Distribution of Mineral Deposits Vol 1. Moscow, Izd-vo AN SSSR,
1958. 532 p. Errata slip inserted. 2,500 copies printed.

Resp. Ed.: N.S. Zhatskiy, Academician; Editorial Board: N.S. Zhatskiy,
Academician, D.I. Shcherbakov, Academician, N.A. Polyayevskiy,
N.M. Dolgopolov, O.D. Levitskiy, Yu.M. Pushcharovskiy, G.A. Sokolov;
Ed. of Publishing House: G.I. Mosov; Tech. Ed.: I.M. Guseva

PURPOSE: This book is intended for geologists and petrographers,
particularly those interested in the worldwide distribution of
minerals and the reasons underlying their occurrence.

COVERAGE: On the basis of particular regional studies this book
attempts to establish the rules governing the distribution of
metallic and non-metallic ore deposits. The work includes articles
on the metallogeny of individual minerals, on broad methodological
problems, and on the possibility of predicting the occurrence of
a mineral in the USSR on the basis of its occurrence throughout
the world. Six maps depicting the distribution of a particular
mineral throughout the world are included with the work.
References accompany each article.

TITLE: An Attempt of Metallogenic Zoning
of the USSR Territory (Opyt metallogenicheskogo
rayonirovaniya territorii SSSR)

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geologicheskaya, 1959,
Nr 4, pp 3 - 21 (USSR)

ABSTRACT:

The author proposes a scheme of metallogenous division of the USSR into five zones of occurrence of endogenous mineral depositis: Alpine, Mesozoic, Hercinian, Caledonian and Proterozoic. More than one mineralization process occurs in each of these zones, the "younger" one superimposed on the older, thus creating zones of polycyclic mineralization. Each of the five zones is divided into ore-provinces as follows: I.-Alpine provinces: a) Far North-East, b) Caucasus, c) Carpathians, d) Kopet-Dag; II. Mesozoic Provinces: Transbaykalian-Maritime zone; III.-Hercinian provinces: a) Ural, b) Kazakhstan, c) Central Asia, and also Donbass, Novaya Zemlya, South Taymyr and Tom'-Kolyvan'

Card 1/2

An Attempt of Metallogenic Zoning of the
USSR Territory

zones; IV. Caledonian provinces: the Altay-Sayan zone and the Northern Taymyr; V. Proterozoic provinces: a) southern part of the Siberian Plateau, b) Baltic shield, and c) Ukrainian shield. Polycyclic mineralization is observed in all provinces. The author gives a detailed description of these provinces, and of the successive mineralization processes occurring there. The following geologists are mentioned in connection with this article: H. S. Shatskiy, A. A. Bogdanov, N. A. Belyayevskiy, M. V. Muratov, S. S. Smirnov, D. I. Shcherbakov, Ye. D. Karpova, and V. M. Sergiyevskiy.
There are 1 map, 1 diagram and 15 Soviet references.

TITLE:

The Evolution of Endogenous Ore Formation (Evolyutsiya endogennoho rudoobrazovaniya)

PERIODICAL:

Priroda, 1959, Nr 4, pp 17-22 (USSR)

ABSTRACT:

The author investigates the geological conditions for the evolution of endogenous ore formation from ancient up to the latest geological epochs and the possible determination of regularities in the distribution of these deposits on Soviet territory. Mostly endogenous deposits are concentrated in plicated areas framing the Russian and Siberian platforms and also in the Baltic, Ukrainian, Aldan and Anabar regions. The author enumerates the main formation periods and gives a map dividing the USSR territory into metallogenic districts and showing that all USSR ore provinces cover plicated or polycyclic areas. Considering only the most important mineralization epochs, the respective ore provinces can be

Card 1/3

The Evolution of Endogenous Ore Formation

SOV/26-59-4-4/43

divided into bicyclic and tricyclic ones and the author lists the main geographic regions belonging to them. Furthermore, he divides endogenous deposits into magmatic, pegmatic, greisen, skarn and hydrothermal genetic groups and gives a short description of each. Several particularities in the chronological development of big ore accumulations correspond to the genetic groups of endogenous deposits in a certain degree. The author divides ore deposits into 6 different groups quoting three Soviet scientists, Academician D.I. Shcherbakov, N.A. Belyayevskiy and Ye.D. Karpova who pointed to the recurrence of the same ore deposits especially "typomorphic" ones, in ancient and recent epochs of ore formation; not only the geological conditions for ore formation are the same, but also the genetic groups. The author reaches the conclusion that the distribution of endogenous deposits in ore provinces is very often subject to the law of regional zoning,

TITLE: Determining the Regularities of Distribution of Mineral Deposits on USSR Territory - the Foremost Purpose of Geological Explorations

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geologicheskaya, 1959, Nr 9, pp 3-11 (USSR)

ABSTRACT: In connection with the foreseen expansion of the Soviet industry, the author stresses the importance of finding a further increase of reserves of mineral raw materials. Therefore, the solution of the problem of elaborating and establishing the regularities of distribution of mineral deposits in the earth's crust on the Soviet territory requires the utmost attention of all Soviet geologists and geological institutes and organizations. The problem was posed by Academician N.S. Shatskiy and its satisfactory solution was recognized by the AS USSR as a most important task. The problem was tackled

Card 1/6

SOV/11-59-9-1/18

Determining the Regularities of Distribution of Mineral Deposits on USSR Territory - the Foremost Purpose of Geological Explorations

long ago by Academician V.A. Obruchev who singled out several metallogenic epochs and regions of Siberia. Theories propounded by A.Ye. Fersman on the regional metallogenic zonality of the Mongolo-Ckhotsk belt served as a base for S.S. Smirnov the creator of Soviet metallogeny for research on regional ore-bearing zones of Eastern Siberia. Further theories on the distribution of mineral deposits were propounded by Yu.A. Bilibin, P.I. Stepanov, Kh.M. Abdullayev, I.M. Gubkin, I.S. Rozhkov, A.N. Zavaritskiy and many other geologists. According to the information gathered by the *Sovet po izucheniyu zakonomernostey razmeshcheniya glavnnyeyshikh poleznykh iskopayemykh pri otdelenii geologo-geograficheskikh nauk AN SSSR* (Council for the Study of Regularities of Distribution of the Most Important Mineral Deposits at the Section of Geolo-

Card 2/6

SCV/11-59-9-1/18

Determining the Regularities of Distribution of Mineral Deposits on USSR Territory - the Foremost Purpose of Geological Explorations

gical and Geographical Sciences of the AS USSR), this problem is presently being studied in 620 different themes. The author further stresses the importance of preparing stratigraphic diagrams and research on the formation of exogenous mineral deposits, as was done by N.M. Strakhov on the accumulation epochs of sedimentary iron, manganese and aluminum ores or by P.I. Stepanov on the stratigraphy of coal accumulation. The elaboration of theoretical bases of natural regularities of distribution of mineral deposits is combined with the compilation of geological maps indicating the already existing and foreseen deposits. Such maps, indicating deposits divided in groups according to their geological age, can greatly facilitate the task of geologists. The experience of geologists of the Academy of Sciences of Kazakhstan, working

Card 3/6

SOV/11-59-9-1/18

Determining the Regularities of Distribution of Mineral Deposits on USSR Territory - the Foremost Purpose of Geological Explorations

under the leadership of K.I. Satpayev, proves it. It is also important that the maps indicate the natural geological elements usually associated with a given mineral. For instance, the maps compiled by I.O. Brod for prospecting for petroleum and natural gas in the Eastern Caucasus. At present, many such maps are near their completion. A creative group of the metallogenicheskiy sektor VSEGEI (Metallogenous Department of the VSEGEI) is preparing a complex metallogenous map for the whole Union on the scale 1 : 2,500,000. The Laboratoriya geologii uglya AN SSSR (Coal Geology Laboratory of the AS USSR) prepares maps of coal-bearing provinces and maps of coal accumulation for different geological periods of the Earth. The Institut geologii i razrabotki goryuchikh iskopayemykh AN SSSR (Institute of Geology and Mining

Card 4/6

SOV/11-59-9-1/18

Determining the Regularities of Distribution of Mineral Deposits on USSR Territory - the Foremost Purpose of Geological Explorations

of Mineral Fuels of the AS USSR) supervises the compilation of maps of petroleum and gas bearing regions of the USSR. In general, only organized groups of geologists of scientific or industrial organizations can cope with the problem and it was therefore decided to create the already mentioned special Interdepartmental Council, as well as special central and local committees. This Council is composed of representatives of the AS USSR, republican Academies, the Ministerstvo Geologii i okhrany nedr SSSR (Ministry of Geology and Conservation of Mineral Resources of the USSR), and of the Vuzes, and presided over by Academician D.I. Shcherbakov. It is composed of five Commissions which are: 1) Commission of Sedimentary Mineral Deposits - chairman Academician N.S. Shatskiy; 2) Endogenous Mineral Deposits - Professor

TITLE:

On the Ore Pebbles in the Upper Rocks of the Urupskaya Copper
Pyrites Deposit. in the North Caucasus (O rudnykh gal'kakh v
porodakh krovli Urupskogo medno-kolchedannogo mestorozhdeniya
na Severnom Kavkaze)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 1, pp 142 - 143
(USSR)

ABSTRACT:

The deposits mentioned in the title are in the north-western
part of the Peredovoy (front) chain of the Bol'shoy (Greater)
Kavkaz (Caucasus) in the upper course of the river Urup - a
left tributary of the Kuban'. It is related to sedimentary-
-volcanogenic sediments which were transformed into greenstone
strata under the influence of the regional metamorphism. The
age determination of the containing complex fluctuates between
Middle Devonian and older formations since the fauna lacks.
The ore deposits form a gently sloping stratiform body of mas-
sive copper pyrites ores which are concordant with the con-
taining rocks. It has distinctly marked contacts and lies on
the base of the tuffs of average composition which rest upon

Card 1/3

On the Ore Pebbles in the Upper Rocks of the Urupskoye SOV/20-126-1-38/62
Copper Pyrites Deposit in the North Caucasus

the quartz albitophyres. The ore body suffered an intensive metamorphism together with the containing rocks. Splinters of pyrites ores were found in tuffs splintered into large fractions in the upper rocks by means of boring 65-90 m above the ore body. The formation of the ore which yielded these splinters before the formation of the volcanogenic-clastic masses is confirmed among other things also by the lacking of the ore disseminations and hydrothermal changes in the rocks beside the ore splinters. The occurrence of angular clasts and the lacking of a limonite crust on their surface is indicative of a rapid displacement over comparatively short distances. Further deposits of ore pebbles in the Ural, Malyy Kavkaz (Lesser Caucasus) and Zakavkaz'ye (Transcaucasia) (Refs 1-3) are enumerated. All these research workers are of the opinion that the ore splinters in the mentioned upper rock point to a partial destruction of the ore deposits at the time of the accumulation of the rocks of the hanging wall and thus fix quite distinctly the period of mineralization. The above mentioned

Card 2/3

observations must, however, be taken into account with respect
to the formation time and its conditions. There are 3 Soviet
references.

TITLE: The Third All-Union Conference on regularities in the formation and distribution of endogenous mineral resource deposits

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geologicheskaya, no. 1, 1963, 126 - 128

TEXT: The Conference was held in Baku from September 18 to 23, 1962; it was attended by 455 representatives from scientific and industrial geological organizations including 24 Academicians and Corresponding Members of AS USSR and AS of various republic, 49 Doctors-Professors and 164 Candidates of Geological and Mineralogical Sciences. The Conference was opened by Academician D. I. Shcherbakov, secretary of OGON, AS USSR. The program of the Conference was divided into three main groups: a) regularities in the formation and distribution of endogenous deposits in the Caucasus; b) regularities in the formation and distribution of endogenous deposits of other folding regions of the Alpine cycle; c) general problems of metallogeny. In group a) reports on basic features

TITLE: Polarizing properties of echellette gratings in the long-wave infrared region

SOURCE: Zhurnal prikladnoy spektroskopii, v. 3, no. 6, 1965, 560-563

TOPIC TAGS: light reflection, light polarization, spectrometer

ABSTRACT: Data are given on the polarizing properties, in the 62 to 650 micron band, of dispersion and filtering echelette gratings used in the monochromator of a long-wave spectrometer (see A. G. Zhukov, Optika I Spektroskopiya, Vol 17, p 284, 1964; English translation in Optics and Spectroscopy).

Reflection of polarized light by the gratings was measured as a function of the orientation of an electric field to the grating steps.

Two wire grids, having periods of 30 microns and spaced a few millimeters apart, served as a highly effective polarizer in the 62 to 650 micron band.

Two cases are considered: 1) in which the electrical field vector is at right angles to the plane of incidence and parallel to the grating steps, and 2) in which the vector is parallel to the plane of incidence and at right angles to the steps. The ratios a_{0p}/a_{0s} and a_{1p}/a_{1s} (where a_{0p} and a_{0s} are the zero order coefficients of reflection for the two cases and a_{1p} and a_{1s} are the first order coefficients, respectively) are used as the measures of grating reflectivity. Curves are plotted for the two cases showing the absolute values of the coefficients and the values of the ratios as dependent on the ratio of the wavelength to grating period. Also shown are curves of summed ratios a_p/a_s plotted as functions of wavelength for three sets of gratings studied. Some of the results differ from those of other authors. Orig. art. has: 3 figures and 1 table.

TITLE: Fatigue strength of steel pipe joints welded by induction heat

SOURCE: Ref. zh. Metallurgiya, Abs. 8E84

REF SOURCE: Tr. Vses. n.-i. in-ta tokov vysokoy chastoty, vyp. 5, 1964, 38-42

TOPIC TAGS: steel, pipe, weld heat treatment, fatigue strength

TRANSLATION: A method was developed for butt welding pipe by induction heat, which gives a welded joint without an inside burr. The contact surfaces of the pipe to be joined were evenly heated to a plastic state (temperature $\sim 1250-1280^{\circ}\text{C}$); this process was followed by the application of pressure resulting in a weld. Tests were made on welded steel-10 pipe of 38/32 mm diameter with changeable bending on an IS-2 machine. A conclusion was reached that joining steel-10 pipe by induction heat welding assures sufficient strength under changeable bending conditions. The presence of an outside reinforcement of the seam joint decreases the fatigue strength of the weld. Heat treatment (normalization) does not affect the increase in the strength of a welded joint with a changeable bending. V. Fomenko.

TITLE: Kinetic energies of fragments with various masses in the fission of U-235 by thermal and fast neutrons ¹⁹

SOURCE: Yadernaya fizika, vl. 2, no. 1, 1965, 92-96

TOPIC TAGS: uranium, nuclear fission, fission product, fast neutron, thermal neutron

ABSTRACT: The kinetic energy distributions of fragments with various masses have been investigated in the fission of U^{235} by thermal neutrons and by neutrons of mean energy 720 kev, for the purpose of comparing the dependence of the total fragment kinetic energies on the fragment mass ratios at the two fissioning-neutron energies. The fission was produced in a layer of uranium enriched 90% in U^{235} , deposited on a thin organic film, and the fragment energy was measured with two surface-barrier silicon detectors. The detector signals were analyzed after amplification by a two-dimensional 128 x 128 channel pulse-height analyzer, which sorted the pulse heights and stored all the information obtained during the measurements.

TITLE: The reduction of counting losses in multichannel recorders by preliminary grouping of events

SOURCE: Pribory i tekhnika eksperimenta, no. 4, 1965, 100-106

TOPIC TAGS: multichannel analyzer, nuclear radiation spectrometer, pulse counter, pulse counting, group theory

ABSTRACT: The majority of registering devices used in nuclear spectrometry exhibit fixed dead time τ . Pulse equalization devices are able to improve somewhat the situation and the quantity $N_{inp} \tau$ (equal to the ratio of the average rate of input pulse arrivals (N_{inp}) to the maximum possible registration rate $N_{pmax} = 1/\tau$) may attain a magnitude $\leq 0.5-0.7$. New experiments now require rates corresponding to $N_{inp} \tau \leq 1$. The present authors studied an approach to counting loss reduction during the registration of statistically distributed pulses by introducing preliminary grouping of events. A theoretical analysis described in detail in the present paper shows that a simultaneous use of group-
Card 1/2
equalization devices substantially reduces the influence of the magnitude

TITLE: Effect of the speed of an ambient medium upon the disintegration characteristics of liquid cylindrical jets

SOURCE: IVUZ. Energetika, no. 4, 1965, 101-104

TOPIC TAGS: fluid flow, liquid jet, liquid jet disintegration

ABSTRACT: The results are reported of an experimental determination of L and D in the disintegration of a liquid cylindrical jet moving with a speed u , in another liquid which moves with a commensurable speed u_2 ; here, L is the length of the solid part of the jet and D is the representative size of the drops formed as a result of the disintegration. A jet of spindle oil was injected, at a rate of 0-0.565 lit/min, into a stream of water flowing at a rate of 0-10.5 lit/min. It

Card 1/2

18 *16*

TRANSLATION: The heat treatment of OKh17N7Yu steel of the transition class generally includes 3 operations: hardening, intermediate working, and annealing. The investigation was carried out on samples with a diameter of 30 mm, after forging and after heat treatment in the manner customary for this brand of steel with annealing at 575-585C (permitting production of articles of the required ductility). Induction heating of the samples for surface hardening was used only for

Card 1/2

L 61038-65

ACCESSION NR: AR5017433

hardening and intermediate treatment. Annealing was done in a furnace (because of the slow rate of dispersion hardening processes). The article gives the distribution of hardness over a cross section of the sample for different heat treatment conditions. Optimum treatment conditions for the sample after preliminary heat treatment ensure a hardness of the surface layer of from 400-415 H_B. Samples after forging, worked under the same conditions, did not have the required hardness. A test of experimental gears made of billets with a diameter of 140 mm and a height of 30 mm subjected to heat treatment in accordance with the results of previous investigations, showed satisfactory results in operation with friction under corrosive conditions, A. Kachapin

TITLE: Rolling of Track Links for Tractors

PERIODICAL: Tekhn. ekon. byul. Sovnarkhoz Chelyab. ekon. adm. r-na, 1958,
Nr 7, pp 43 - 45

ABSTRACT: Information is given on technical possibilities and economical effectiveness of changing the manufacture of track links for S-80 tractors from stamping to longitudinal periodic rolling. Experimental rolling of links on a scale of 1 : 2, 1 : 3, 1 : 4, was carried out on a ChTZ test mill with rollers of 470 mm in diameter and on a UPI laboratory mill with rollers of 200 mm in diameter. Technical Specifications were developed for the design of a rolling mill and the principal scheme of the technological process was set-up for the production of links on a continuous automatic line. The rolling mill has rollers of 1,100 mm in diameter, revolving at a speed of 10 or 15 revolutions per minute, 44
