BOOK EXPLOITATION

S/

Sokolov, Petr Vasil'yevich (Candidate of Economical Sciences, Docent in the Department of Political Economy)

War and human resources (Voyna i lyudskiye resursy\*), Moscow, Voenizdat, 1961, 137 p. 20,000 copies printed.

TOPIC TAGS: military reserve, wartime mobilization, logistics, labor force, casualties, human resources

PURPOSE AND COVERAGE: This book examines the problem of human resources in war, which are an important indicator of the military potential of states and have an effect on the course and outcome of armed conflicts. The book throws some light on the human composition of the armed services, changes in the size of armies, training of military reserves in connection with the change in the materiel-technical base of war, with the development of rocket-nuclear weapons; the sources of human resources and also the factors affecting the capacity for military and labor mobilization of the populace are discussed. The book does not pretend to give an exhaustive answer to all these questions. On the basis of the experience gained in past world wars and analysis of contemporary circumstances certain problems of human resources in war are considered; the need for a detailed study of the econo-

AUTHORS: Tolstoy, N. A. and Sokolov, R. A.

TITLE: Luminescence of thallium chloride single crystals

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya,  
v. 25, no. 3, 1961, 375-376

TEXT: This paper was read at the Ninth Conference on Luminescence (Crystal Phosphors) held in Kiyev from June 20 to June 25, 1960. The spectral composition and the intensity of luminescence of single crystals of thallium chloride were studied after different treatments of the crystals which were bred by the authors themselves. The luminescence was excited by light of wavelength  $365\text{ m}\mu$  at the temperature of liquid nitrogen; the measurement of the specimens was done in a helium atmosphere. It turned out that thallium chloride has three luminescence bands: 1) a blue band with the maximum at about  $460\text{ m}\mu$  (Fig. 1, Curve 1); 2) an orange band with the maximum near  $620\text{ m}\mu$ ; 3) a dark-red band with the maximum at  $740\text{ m}\mu$ . The blue band appears immediately after breeding; the orange band appears after plastic deformation (Fig. 1, Curve 2),

and the dark-red band after a heat treatment of the specimens in a pure He atmosphere (Fig. 1, Curve 3). Long exposure to ultraviolet light ( $\lambda = 365 \text{ m}\mu$ ) at temperatures lower than  $-150^\circ\text{C}$  did not lead to any remarkable change in luminescence. At higher temperatures, the intensity of the whole spectrum decreased. In this case, the blue luminescence was extinguished more quickly than the luminescence of longer wavelengths (Fig. 1, Curve 4). Measurements of the intensity of luminescence  $I$  in the maximum of the blue band as a function of the time of exposure to light of wavelength  $365 \text{ m}\mu$  showed that  $I$  decreases hyperbolically with an increase of  $t$  according to the rule  $I = I_0/(1+At)$ . Here,  $I_0$  is the initial intensity and  $A$  a constant depending on the temperature and intensity of irradiation. By a parallel measurement of the light transmittance of the Hg line with  $\lambda = 436 \text{ m}\mu$ , it was found that in this spectral range the transmittance after the exposure does not change markedly (Fig. 2). Therefore, the weakening of the observed luminescence cannot be explained as a "filter effect". The decrease of intensity on exposure is a reversible process: By aging the exposed specimen in the dark, luminescence is restored almost completely. The restoration of luminescence

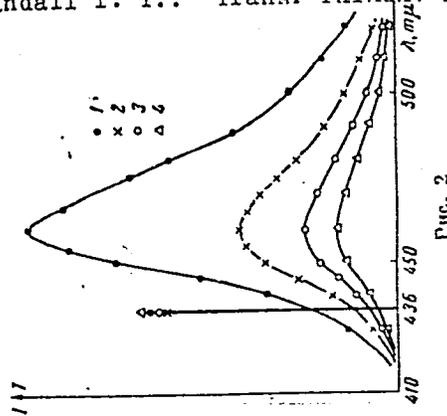

Card 2/4

Luminescence of thallium...

S/048/61/025/003/025/047  
B104/B214

is accelerated at higher temperatures. It can be assumed that the lattice defects are the centers of blue luminescence. The orange luminescence band with its maximum near 620 m $\mu$  results from mechanical defects (dislocations); this agrees with assumptions made in other paper. The dark-red band is evidently caused by the impoverishment of the crystals in chlorine. Possibly an electron from the escaped chlorine atom fills this place and forms an F-center. There are 2 figures and 3 references: 1 Soviet-bloc and 1 non-Soviet-bloc. The reference to the English-language publication reads as follows: Randall I. T.. Trans. Faraday Soc., 35, 6 (1939).

15 Effect of the composition of pine tars on the reclaiming of SKP-natural rubber tire stocks. S. A. Sokolov and V. F. Drozdovskii. *Kauchuk i Resina* 16, No. 8, 12-15(1957).

Fine tar (I) was treated with H<sub>2</sub>O at 70-80°, the H<sub>2</sub>O-sol. acids (II) filtered, the residue treated with gasoline and the gasoline-insol. portion (III) removed, the filtrate treated with 8% KOH, the neutral oils (IV) sepd., rosin:acids and other higher acids (V) pptd. with BaCl<sub>2</sub> (and redissolved in HCl), leaving the phenols (VI) in the filtrate. The effect of each separate fraction on the reclaiming process was: II destroys cord fibers; III, effect unknown; IV swells stock, participates in joint oxidation with stock; V participates in oxidation; VI inhibits oxidation. The effect upon the quality of the reclaim was: II imparts dryness and improves plasticity; III facilitates processing, lowers plasticity, and raises tensile strength of vulcanizate; IV increases softness, reduces tensile strength, and improves appearance of product; VI improves plasticity. Thus the properties of I depend on the proportions of the fractions, and this mixt. is recommended for reclamation procedures: II 2-3%, III 8-10, IV 50-5, V 20-5, VI <10, other compds. <10%.

SOV/138-59-4-8/26

AUTHORS: Drozdovskiy, V.F., Sokolov, S.A. and Dogadkin, B.A.

TITLE: The Effect of Sulphur-Containing Derivatives of Carbazole on the Regeneration of Rubbers (Sliyaniye serosoderzhashchikh proizvodnykh karbazola na protsess regeneratsii rezin )

PERIODICAL: Kauchuk i Rezina, 1959, Nr 4, pp 29-31 (USSR)

ABSTRACT: The addition of small quantities of activators shortens the time of regeneration of rubbers and also makes it possible to use smaller quantities of plasticizers. Various sulphur-containing compounds such as mercaptans, zinc salts of mercaptans and alkyl phenol sulphides are used as activators during the regeneration of natural and synthetic rubber vulcanisates. The Polish patent specification 35298 (1953) (Ref 6) mentions the use of a mixture of mercapto-anthracene and mercapto-carbazole. The effect of these compounds on the process of regeneration and on the vulcanization process of a mixture of SKB and NK rubbers was investigated. The rubbers were regenerated by heating them for five hours at 180°C and tested according to the standard for regenerated tyre rubbers GOST 3550-54. During the test the product obtained

Card 1/3

SOV/138-59-4-8/26

The Effect of Sulphur-Containing Derivatives of Carbazole on the Regeneration of Rubbers

by interacting carbazole with sulphur monochloride and morpholine disulphide was used (Table 1). Literature data (Ref 7) indicate that morpholine disulphide itself acts as vulcanizing agent and also as a vulcanization accelerator. Experiments were carried out to test the effect of the product obtained by the interaction of carbazole and sulphur monochloride on the vulcanization process of natural rubber at 143°C. Results indicated that this product also acts as vulcanizing agent and vulcanizing accelerator, but is less effective than morpholine disulphide. 3-mercapto carbazole was prepared according to data given earlier (Ref 8) and its effect compared with that of "Renatsit" II (Table 2). Results showed that 3-mercapto carbazole is more active than trichlorothiophenol ("Renatsit" II). The activity of 3-thiocyanate carbazole and  $\alpha,3$ -dithiocyanate carbazole was also tested (Table 3),

Card 2/3

SOV/138-59-4-8/26

The Effect of Sulphur-Containing Derivatives of Carbazole on the Regeneration of Rubbers

and it was shown that purified 3-thiocyanate carbazole was equally effective as "Renatsit" II. The x,3-dirhodanate carbazole, however, was unsatisfactory. (Table 4). The authors concluded that the 3-mercapto carbazole and 3-rhodanate carbazole are satisfactory compounds to be used during the regeneration of rubbers, and their action is analogous to that of mercaptans. There are 4 tables and 10 references, 8 of which are English, 1 Soviet and 1 Polish.

TITLE: The use of gas-producing resins in rubber reclaiming

PERIODICAL: Kauchuk i rezina, no. 1, 1962, 52 - 53

TEXT: The disadvantages of dry-distillation of pine tars, for use as softeners in rubber reclaiming are non-uniformity and high cost. In the attempt to find new resins for this purpose, gas-producing ones proved to be the most successful. The Chekhov Rubber Reclaiming Plant developed the composition of a resin and a technology of rubber reclaiming, using the product of the Izhevsk Plant in 1958. This product has the following advantages: 1) Uniformity in group composition of the softener, leading to improved physico-mechanical properties of the reclaimed rubbers. 2) Reduced production cost of the reclaimed rubber. 3) Increased capacity output of the refining rollers. 4) Increased capacity output of the autoclaves due to a shorter rubber devulcanization process. 5) Improved receiving and storage methods of the resin, eliminating the use of wooden barrels. The Chekhov Recovery Plant produced 6.5 thousand tons of reclaimed rubber in 1959. In 1960, the Recovery Plant consumed 2,000 tons of resin. There is 1 table.

TITLE: Protection against direct lightning strokes of reinforced-concrete communication-line poles. (Zashchita zhelezobetonnykh opor lininiy svyazi ot pryamykh udarov molnii).

PERIODICAL: "Elektrosvyaz" (Telecommunications), 1957, No.4, April, pp. 67 - 74 (U.S.S.R.)

ABSTRACT: The authors give results of experiments undertaken by TsNIIS at the proving grounds in Golitzyn in 1955. The results obtained may be given as follows: reinforced concrete poles can be used as a lightning conductor without special earthing systems. Measurements showed that their resistance is 20 to 70 ohms, while the soil resistivity is of the order of 300 ohm/meter. From theoretical considerations, no excessive temperature rise of armature, with subsequent damage to the concrete, is to be expected. This was proved experimentally on poles subjected to current pulses up to 60 000 amps. Experiments have also shown that damage to the concrete occurs for every lightning stroke. The breakdown occurs at voltage pulses of 33 - 34 kV with corresponding current pulses of 5000 amps or higher. For very large currents (50 000 to 60 000 amps) disintegration of concrete should not be unexpected, especially in the

TITLE: Reduction of the Earth Resistance in Rock Localities and in Regions of Ever-Frozen Ground (O snizhenii soprotivleniy zazemleniy v skal'nykh mestnostyakh i v rayonakh vechnoy merzloty)

PERIODICAL: Elektrosvyaz', 1959, Nr 6, pp 65-70 (USSR)

ABSTRACT: The article consists of two parts: 1) a theoretical investigation and experiments on laboratory models; 2) results of experimental field work. The equipotential surfaces of a tubular earthing rod can be represented by ellisoids of revolution (Fig 1). If the ground is cut out to a depth

$$z_{\beta} = u = \sqrt{a^2 + l^2}$$

(symbols as shown in Fig 1), then the lines of current flow will not be distorted and the total resistance of the earth  $R_H$  will be

$$R_H = R_1 + R_2 = \frac{1}{2\pi l} \left[ \rho_H \ln \frac{2}{a_0} + (\rho_{cm} - \rho_H) \frac{1}{2} \ln \frac{\sqrt{l^2 + a^2} + l}{\sqrt{l^2 + a^2} - l} \right]$$

Card 1/5

(4)

SOV/106-59-6-9/14

## Reduction of the Earth Resistance in Rock Localities and in Regions of Ever-Frozen Ground

where  $R_1$  is the resistance of the replaced layer,  $R_2$  is the resistance of the remaining earth,  $\rho_H$  is the specific resistance of the hole material,  $\rho_{cm}$  is the specific resistance of the earth. This relationship is deduced from Ollendorf's work "Currents in the Earth", Ref 1. Fig 2 shows the relationship between  $\xi = \frac{R_H}{R_{cm}}$  and  $\alpha = \frac{\rho_{cm}}{\rho_H}$  and  $a_T$  for  $\ell = 2.5$  cm;

$R_{cm}$  is the resistance of the earth before the hole is made. Changing the diameter of the tube within the limits 4 to 7 cm has little effect on the value of  $\xi$ . Fig 2 shows that 1) increasing  $\alpha$  is effective up to 2.5 - 3 m only; 2) reduction of the specific resistance  $\rho_H$  of the filled-in material is useful over a limited range (up to  $\alpha = 5 - 10$ ). Thus, the use of a large quantity of good-conducting material around the earth point is wasteful. Experiments on models in the Central Scientific Research Communications Institute confirmed the theoretical results. The experiments are described and the results tabulated in Table 1. The results

Card  
2/5

SOV/106-59..6-9/14

Reduction of the Earth Resistance in Rock Localities and in Regions of Ever-Frozen Ground

indicate that the earth resistance can be reduced 2.5 to 3 times by making a zone with a low specific resistance round the earth point. The hole should have a radius 1.5 to 2 m and a depth equal to the length of the tube in the ground. The hole is filled with a material having a specific resistance 5 to 10 times lower than the specific resistance of the ground, and the tube is driven into the material. Experimental earths were set up at a number of places (Skovorodino and others). The earths used various quantities of common salt (8 - 40 kg) and some of the earths were processed by Sanick's method, using  $\text{Cu}_2\text{Fe}(\text{CN})_6$  gel. The results showed that the resistances of all the earths, which had the same initial resistance but different amounts of salt, changed by approximately the same amount. Electrodes processed by Sanick's method after working at low temperatures for several months acquired high resistance values, approximating to the values of the unprocessed earths. Investigation on models in a cold chamber show that the gel in the earth decomposed and was destroyed by water. The ground

Card 3/5

SOV/106-59-6-9/14

Reduction of the Earth Resistance in Rock Localities and in Regions of Ever-Frozen Ground

temperature has a great effect on the earth resistance. The resistance of sand with 3.7% moisture content increased eight-fold when the temperature fell from 0 to 8 °C. In regions where the ground is always frozen, there is a stable temperature (mean value -1.5°C) at depths below 2.5 to 3 m. Above this depth, seasonal temperature variations giving temperatures very much below -5°C occur. Table 2 gives monthly variations in temperature for various depths at Skovorodino, Amurskaya Oblast'. Tables 3 and 4 show the effects of snow layers on ground temperature. The temperature is also strongly affected by vegetation, particularly mosses. Thus, when installing earths, the temperature regime of the ground should be investigated. Best results are achieved by

AUTHOR: Sokolov, S.A.

TITLE: The Probability of Damage by Lightning to Subterranean Cable Lying Alongside a Wood

PERIODICAL: Elektrosvyaz', 1959, Nr 8, pp 67 - 75 (USSR)

ABSTRACT: A subterranean cable in the centre of a wood is just as liable to lightning damage as one situated in an open field, but a cable running in the vicinity of a wood obtains a degree of protection from the trees at the edge of a wood (Figure 1). The edge trees give a protection zone in a manner similar to lightning conductors. A.A. Akopyan (Ref 1) has established the dimensions of the protection zone of lightning conductors on the assumption that not one strike out of a 1 000 strikes will fall in the unprotected zone. The greatest radius of the protection zone on the Earth's surface for rod lightning conductors is  $r = 1.5h$ , where  $h$  is the height of the lightning conductor. The author describes the development of a lightning flash and the methods in which damage can result to the cable.

Card 1/7

05377

SOV/106-59-8-9/12

The Probability of Damage by Lightning to Subterranean Cable Lying  
Alongside a Wood

As the lightning leader approaches the earth, charges move through the earth to the point underneath the leader. The instant the leader reaches the earth and the reverse strike starts the potential of this point can be so high that an electric arc occurs between the point and the cable. The arc is able to cross a distance given by:

$$y = 1.1 \sqrt{\frac{i\rho}{e_0}} \quad (1)$$

where  $\rho$  - the specific resistance of the earth, ohm - m,  
 $i$  - the lightning current, kA,  
 $e_0$  - the critical electric field strength in the earth at which a rupture occurs, kV/m.

Table 1 shows the relationship between  $e_0$  and  $\rho$ .

A calculated example ( $\rho = 1\ 000$  ohm - m,  $i = 250$  kA) shows that the maximum value of  $y_{\max}$  is of the order

Card2/7

05377

SOV/106-59-8-9/12

The Probability of Damage by Lightning to Subterranean Cable Lying  
Alongside a Wood

of 20 m. Thus, lightning strikes more than  $y_{\max}$  from the cable will not cause arcing. This does not, however, mean that no damage to the cable will result. The lightning current is an aperiodic wave of 20 to 100  $\mu$ s. When such a current wave flows in a cable sheath, a potential difference between the sheath and the conductors arises and this potential may puncture the insulation. Table 2 shows the sheath current amplitude  $i_0$  which will cause damage to the cable with an insulation breakdown strength of 2 000 V. The relationship between  $y$  and  $i_0$ , as given by Sunde (Ref 4), is:

$$i = i_0 \frac{\ln l/\gamma a}{\ln(1/\gamma y + 1)} \quad (2)$$

Card3/7

05377

SOV/106-59-8-9/12

The Probability of Damage by Lightning to Subterranean Cable Lying  
Alongside a Wood

where  $\gamma \approx 0.08/\sqrt{\rho}$  is the "propagation" constant of the lightning current along the sheath,  $1/m$ , and  $m$  is the radius of the cable,  $m$ .

Within some distance  $y_1 < y_{max}$  from the cable, damage is produced by an electrical arc to the cable; also for lightning strikes further than  $y_1$ , damage occurs, without an arc, only when the current exceeds the value  $i_0$

(although arcing may occur).

The author then shows that the total number of cases in which a subterranean cable is damaged by lightning in the course of a year is given by:

$$n = 2qNS \int_0^Y e^{-Ki} dy = 2qNS \left( \int_0^{y_1} e^{-Ki} dy + \int_{y_1}^Y e^{-Ki} dy \right) \quad (5)$$

Card4/7

05377  
SOV/106-59-8-9/12

The Probability of Damage by Lightning to Subterranean Cable Lying  
Alongside a Wood

- where  $q = 0.1$  - the number of lightning strikes per  $\text{km}^2$  per stormy day,
- $S$  - the length of the cable (m),
- $N$  - is the number of stormy days per year in the locality,
- $Y$  - is the maximum distance from cable at which a lightning strike can cause damage to the cable,
- $i$  - is the lightning current amplitude,
- $(0, y_1)$  - is the distance from the cable in which an arc will occur,
- $(y_1, Y)$  - the space interval from the cable in which damage will occur without arcing.

Integration of Eq (5) gives:

$$n = 2qNS \left[ Y e^{-KI} + K \int_{i_0}^{i_1} y e^{-Ki} di + K \int_{i_1}^{\infty} y e^{-Ki} di \right] \quad (6)$$

Card 5/7

05377

SOV/106-59-8-9/12

The Probability of Damage by Lightning to Subterranean Cable Lying  
Alongside a Wood

where  $i_1$  is the value of the current at  $y_1$  as found from Eqs (1) and (2),  $I$  is the maximum possible lightning current. Letting the cable be at a distance  $y = l$  from the edge of a wood and taking  $l < 1.5h$  (Figure 2), the author shows that probable number of cases of cable damage is given by Eq (9), which is shown graphically in Figure 3 as a function of  $h$  (for  $\rho = 800$  ohms). Table 3 gives the optimum distance of the cable from the wood for various values of  $\rho$  and  $h$ . It is pointed out that these formulae do not take into account the influence of the tree roots. In practice, the distance given in Table 3 should be increased by the length of the roots.

The author next investigates the probability of damage to a cable buried along a path in a wood and shows that the maximum width of a strip protected by the trees is  $7h$ ; this assumes that the locality is level and the trees are not lower than 6 to 8 m high. Finally, the author

Card6/7

05377

The Probability of Damage by Lightning to Subterranean Cable Lying  
Alongside a Wood

SOV/106-59-8. 9/12

investigates the effect of single trees or other high objects near the cable and the effect of nearby overhead communication lines near the cable on the probability of damage to the cable.

There are 3 figures, 3 tables and 8 references, of which 7 are Soviet and 1 English.

AUTHOR: Sokolov, S. A.

TITLE: Subterranean communication cables struck by lightning. Influence of the radioactivity of the ground

PERIODICAL: Elektrosvyaz', no. 5, 1960, 71

TEXT: It was supposed that the ionization of the air by the radioactive substances contained in the ground would facilitate the process of discharge of atmospheric electricity, and that the lightning would therefore strike, in the great majority of cases, the points with increased radioactivity. Laboratory experiments carried out for the construction of lightning arresters with radioactive cartridges strengthened this hypothesis. To check it under natural conditions, the TsNIIS laboratory chose a trunk-line that had been often damaged by lightning (the cable had been struck 3 to 4 times per thunderstorm-season). Measurements of the radioactivity of the ground were effected within a zone 195 km long. Recording tests were made at least every 500 m. The radiometer used for these tests allowed to record the radioactivity in any point of the followed track, even in water. The obtained results did not reveal any relationship

TITLE: Voltages arising during lightning strokes in symmetrical cables at repeater stations

SOURCE: Elektrosvyaz', no. 7, 1965, 63-70

TOPIC TAGS: repeater station, surge voltage

ABSTRACT: The surge-voltage height and duration in an underground metal-sheath cable depends on the distance to the point of lightning discharge, lightning-current height and shape, earth resistivity, and cable construction. Formulas for the sheath-conductor and conductor-conductor voltage surges are derived. Lightning strokes were simulated by current impulses derived from a 50-kv surge generator capable of developing currents up to 20 ka. The impulses were applied at distances of 100, 750, 1400 m from a repeater station between the cable and a

Card 1/2

L 3943-66

ACCESSION NR: AP5018029

0

ground electrode buried at 100 m from the cable; impulse heights used were 1.5-10 ka; the measured sheath-conductor surge voltages were 0.42-95 v. It is found that, with a sound cable, the induced surges are not hazardous; they may reach hazardous values if one of the cable conductors is faulty (broken or grounded). However, in the latter case, the equipment is adequately protected by an R-4 lightning arrester. Orig. art. has: 6 figures, 9 formulas, and 2 tables.

Series: Accomplishments of Soviet Cinema Technique

Text Data

Coverage: The book is the fourth in the series "Accomplishments of Soviet Cinema Technique" and describes the basic methods of taking colored motion pictures. The technique for black-white photography was given in the three previous books. A description of the combined and special types of production now adapted in Soviet cinema studios and the technique of cinema stage settings will be published in one of the following issues of the series.

The book primarily describes the lighting equipment, lenses and deflectors, electric power units for light effects, and arrangements for color-photographic balances of different intensities. The book also gives brief data on: apparatus for normal and synchronic methods of taking pictures; narrow and broad films; tripods of various types; controlling method and mechanisms in cinematographic apparatuses.

Purpose: General information for wide circle of specialists in motion pictures.

Facilities: Scientific Research Institute for Motion Pictures and Photography (N.I.K.F.I.); cinema-studios in Moscow and Leningrad regions.

TITLE:

Synthesis of Aromatic  $\beta$ -Ketoacetals

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 8, pp 2570-2575  
(USSR)

ABSTRACT:

The  $\beta$ -ketoacetals which are mainly obtained from the corresponding  $\beta$ -chloro-vinyl ketones (Ref 1) are recently of manifold use in organic synthesis, whereas compounds of this class with aromatic radicals have nearly escaped notice (Refs 2-5). Quite recently, the authors synthesized the ethylene acetal of the benzoyl-acetaldehyde (Ref 6). Presently, they carried out the synthesis of various aryl- $\beta$ -ketoacetals using, as initial products, the acyl- $\beta$ -chloro-vinyl ketones which are now well accessible (Ref 7). Three new representatives of this class, the o-tolyl- and m-tolyl- $\beta$ -chloro-vinyl ketone, and the n-bromo-phenyl- $\beta$ -chloro-vinyl ketone, were synthesized. On the first attempts to obtain the acetal of benzoyl-acetaldehyde according to reference 1, the phenyl- $\beta$ -methoxy-vinyl ketone (II) was formed instead of the expected compound. This was due to the catalytic action of alkali traces left over in the re-

Card 1/3

SOV/79-29-8-24/81

Synthesis of Aromatic  $\beta$ -Ketoacetals

action. Therefore, the reaction conditions were altered in such a way that in the distillation any traces of alkali were excluded by treating the reaction mixture with water, and extracting with ether. Thus the acetal of the benzoyl-acetaldehyde (III) resulted in a 60% yield. More convenient are the ethylene acetals of the  $\beta$ -ketoaldehydes which were recently synthesized by the authors (Ref 6). From among the representatives of the aromatic series, only the ethylene acetal of the benzoyl-acetaldehyde (IV) is described in publications. The fact that the cyclic ethylene acetals, which can easily be obtained by reaction of  $\beta$ -chloro-vinyl ketones with ethylene glycol, are formed by treating both the dimethyl acetals and the alkoxy-vinyl ketones with ethylene glycol in the presence of alkali, indicates their considerably higher stability. All transformations described, which are connected with the investigation of the stability of the acetals of the benzoyl-acetaldehyde, are illustrated in scheme 1. KOH and  $K_2CO_3$

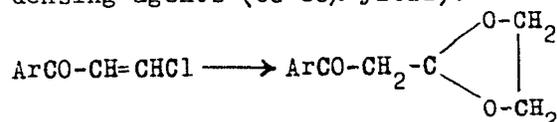

(Ref 6) proved to be the agents most useful for condensing the ethylene acetals of the  $\beta$ -ketoaldehydes of the aliphatic series. The operational method devised for the synthesis of the first member of the series was further applied to the syn-

Synthesis of Aromatic  $\beta$ -Ketoacetals

thesis of the ethylene acetals of the  $\beta$ -ketoaldehydes substituted in the aromatic nucleus, using KOH and  $K_2CO_3$  as condensing agents (60-80% yield):

where Ar = n,m,o- $\text{CH}_3\text{C}_6\text{H}_5$ ; n,o- $\text{ClC}_6\text{H}_4$ ; n- $\text{BrC}_6\text{H}_4$ ; n- $\text{CH}_3\text{o-C}_6\text{H}_4$ .

The resultant crystalline acetals are stable, in general well soluble, and do not color with ferric chloride. There are 1 table and 14 references, 6 of which are Soviet.
