TITLE: Calculation of unsteady state temperature fields in plates and
shells using a computer

SOURCE: Teploenergetika, no.3, 1966, 53-57

TOPIC TAGS: temperature distribution, computer program, computer calcu-
lation, temperature, shell structure, aerospace structure

ABSTRACT: The article proposes approximate methods for calculating un-
steady state temperature fields which greatly simplify the calculation
and which give results which are satisfactory in accuracy for practical
purposes. The mathematical development of the method considers a shell
of arbitrary shape and variable thickness, with respect to a curvilinear
orthogonal coordinate system. The remainder of the article consists of
the working out of a detailed computer program for the given problem.
The method and the program were used to investigate the effect of differ-
ent factors on the temperature field and the stresses in turbine vanes
and disks. Calculated results are shown in a figure. The solution of

TITLE: Remodeling Gas Rotary-Hearth Furnaces for Annealling the Press Mounts
of Receiving Tubes

PERIODICAL: Radiotekhn. proiz-vo, 1957, Nr 10, p 55

ABSTRACT: A rotary-hearth furnace has been designed for high-quality annealling of tube mounts. The furnace has 90 cast-iron "pockets;" 6 of them are heated by three pairs of opposing flat-flame burners, 72 pockets are in a tunnel (without heating), and 12 pockets are open on the top. The annealling time is 14 min, and output temperature, 140-150°C. The process consists of holding the mount at the highest temperature, gradually reducing the temperature in the annealling zone, and cooling. One of the pockets is equipped with a thermo-couple that moves along with the mounts. To facilitate repairs, the tunnel is detachable.

CITED SOURCE: Tr. Mosk. energ. in-ta, Vy-p. 47, 1963, 225-233

TOPIC TAGS: EI-612 steel, steel thermal fatigue, thermal fatigue, stressed state, single axis stress

TRANSLATION: The author studied the repeated plastic deformation of pipe samples. To obtain comparable results, the average temperature of the cycle was kept constant in the various tests. Experimental dependences were obtained for the number of cycles up to the destruction point on the change in plastic deformation per cycle, as well as the stress drop per cycle as a function of the number of cycles.

It was found that considerable weakening occurs during thermal fatiguing of the material. To evaluate the resistance to the appearance of cracks in metal

Hydrodynamics of high-speed vessels (Gidrodinamika bystrokhodnykh sudov) Leningrad, Izd-vo "Sudostroyeniye", 1965. 383 p. illus., biblio. 2100 copies printed.

TOPIC TAGS: hydrofoil, equilibrium flow, unsteady flow, lifting surface force, hydrofoil resistance, hydrofoil lateral stability, air cushion vessel

PURPOSE: This book is intended for use by scientific workers, design engineers, and those specializing in ship's hydromechanics.

COVERAGE: This book reports the results of theoretical investigations of the hydrodynamics of gliding vessels, hydrofoil vessels, and ACV's. Main attention has been devoted to methods of calculating the hydrodynamic characteristics of the lifting surfaces of these ships as well as methods for determining their seaworthiness.

TITLE: Aerosol component of spectral transparency of atmospheric haze in the 0.5 - 14 micron wavelength range

SOURCE: IVUZ. Fizika, no. 3, 1966, 7-13

TOPIC TAGS: aerosol, atmospheric transparency, particle distribution, atmospheric optics, atmospheric water vapor

ABSTRACT: The author analyzes the behavior of the relative aerosol attenuation coefficient as a function of the wavelength, the meteorological distance, the propagation distance of the radiation, the particle-dimension distribution function, and the minimum and maximum radii of the particles. Both horizontal and oblique propagation of radiation in haze are considered. The various factors entering in the expression for the attenuation coefficient are gathered from the literature, and tables of the attenuation coefficient and of its spectral components are presented. The data obtained are sufficient to calculate the spectral transparency of the aerosol component of attenuation of radiation by atmospheric haze in the lower 5-km layer of the atmosphere for different relative placements of the receiver and of the source. Some practical plots of the spectral transparency variations are presented. Although the

Card 1/2

L 0372-67
ACC NR: AP6023407

calculations are made for homogeneous spherical droplets, the results are applicable to two-layer particles of irregular shape. It is pointed out in the conclusion that a rigorous theoretical solution of the problem of attenuation of particles of irregular form cannot be obtained at present because of lack of data on the shape and chemical composition of particles of the atmospheric aerosol. Orig. art. has: 6 figures, 15 formulas, and 2 tables.

TITLE: Radiative corrections to scalar meson pair production in electron position collisions

SOURCE: Zhurnal eksper. i teor. fiziki, v. 44, no. 6, 1963, 2081-2086

TOPIC TAGS: electron position collision, scalar meson pair production, radiative correction, anomalous behavior, threshold

ABSTRACT: The perturbation-theory series for the production of a pair of pions in electron-positron collisions is summed in the doubly-logarithmic approximation, with the aim of checking on the characteristic change in the behavior of the cross section near the threshold of the reaction, brought about by the account of radiative corrections, as noted by Bayer and Kheyfets (ZhETF v. 40, 715, 1961) for the case of a fermion pair production. The Duffin-Kemmer formulation is used for the analysis. It is demonstrated that this characteristic change in cross section holds true for pion production.

TITLE: Gauge invariance and photon mass B

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 47,
no. 3, 1964, 1003-1006

TOPIC TAGS: vector meson, photon, photon mass, gauge invariance,
quantum electrodynamics

ABSTRACT: This paper was stimulated by the report of Ogievetskiy
and Polubarinov (ZhETF v. 41, 247, 1961), in which the possibility
was noted of a gauge invariant formulation of the theory of a neu-
tral vector meson of nonvanishing mass. Since this casts doubt on
the theoretical justification for the vanishing of the physical mass
of the photon, the author shows briefly that the requirement of
gauge invariance does lead to the vanishing of the polarization

Card 1/2

L 11064-65

ACCESSION NR: AP4046420

Operator $\Pi_{\mu\nu}(0) = 0$, and ascertains under which conditions this requires that the physical mass of the photons must be equal to zero. Although this is a natural consequence of gauge invariance, provided the photon mass is of purely dynamic origin, this is not the only possible consequence. "The authors thank V. E. Bozov, V. M. Galitskiv, and G. A. Khoyfets for discussions." Orig. art. has: 12

TITLE: The Lehmann representation and the photon mass

SOURCE: Yadernaya fizika, v. 1, no. 5, 1965, 908-911

TOPIC TAGS: spectral representation, photon mass, meson mass, bare mass, Green's function, scalar meson, vector meson

ABSTRACT: It is shown, by making use of the analogy between pseudo-scalar meson theory and quantum electrodynamics, and particularly by considering the difficulty arising in the latter in connection with the Landau pole, that if the bare mass of the meson is zero, then the spectral representation can yield no information on the photon mass. The most important result of this deduction is that the transverse part of a vector field is uniquely determined only for nonvanishing bare masses. The authors thank V. I. Ogiyevetskiy who called their attention to the essential role of a certain quantum electrodynamic

TITLE: D-c parameters of nonlinear resistors

SOURCE: IVUZ. Priborostroyeniye, v. 7, no. 3, 1964, 39-44

TOPIC TAGS: resistor, nonlinear resistor, nonlinear resistor parameters

ABSTRACT: The parameters of simple nonlinear resistors whose V/I characteristic traverses the origin of coordinates, i.e., the resistors having no internal emf source, are considered. Nonlinear resistors, including those possessing negative resistance (tunnel diodes), have a continuous, single-valued V/I characteristic. A special parameter, "resistance response," is introduced for evaluating the static resistance inertia:

$$\mu_r = \frac{(R_0 - p)(\sigma - R_0)}{(\sigma - p)\tau},$$

Card 1/2

L 18957-65
ACCESSION NR: AP4041648

where R_0 is the static resistance, ρ is the dynamic resistance, σ is the "argumental" resistance, and τ is the time constant. Another special parameter, "resistance trend," is defined as: $\gamma = \frac{R_0}{R_0 - \rho}$; these parameters are used for setting up differential equations describing various circuits that contain LC, nonlinear, and linear resistances. Orig. art. has: 2 figures and 17 formulas.

AUTHOR: Sokolov, V. V.; Pelekhatyy, M. I.

TITLE: Effect of noise correlation on the noise immunity of coherent reception in PM telegraphy

SOURCE: 'Elektrosvyaz', no. 3, 1965, 23-31

TOPIC TAGS: noise immunity, PM telegraphy, radio telegraphy, coherent reception

ABSTRACT: The possibility is theoretically considered of increasing the noise immunity of coherent reception, in phase-modulation telegraphy, by increasing the correlation of noise at the synchronous-detector inputs; this is achieved by equalization of the transmission factors of the received and reference signals; the correlation factor tends to approach 1 in this case. Formulas are derived which characterize the noise immunity of the coherent method under various conditions;

Card 1/2

L-55224-65
ACCESSION NR: AP5009815

the noise immunity inherent to the phase-comparison method is also considered. The effect of circuit parameters on the noise-correlation factor is explored. These findings are reported: (1) It is possible in principle to obtain a higher noise immunity, with time-varying channel parameters, by increasing the noise correlation between the received and reference signals in the synchronous detector; (2) The noise correlation factor can be augmented by widening the reference passband up to a value equal to the signal band with a corresponding equalization of the phase characteristics of both circuits. Orig. art. has: 6 figures and 23 formulas.

AUTHOR: Sokolov, V. V.

TITLE: Peculiarities of the passage of phase-telegraphy signals through
the selective channel of a receiver.

PERIODICAL: Elektrosvyaz', no. 11, 1961, 3 - 12

TEXT: In this article, dealing with the passage of phase-keyed signals through the selective channel of a receiver, the author examines the transients in the general case, i.e., when the frequency of the incoming signal does not coincide with the mean frequency of the receiver passband. The selective channel is supposed to be an n-stage resonance amplifier with single tuned circuits (anode circuits). If the phase jump in the input signal is $\Delta\theta = \theta_2 - \theta_1$, the compound signal at the receiver output can be considered as the sum of the decaying oscillations that arise when the input voltage with phase θ_1 is switched off, and of the growing oscillations that arise at the output when a voltage with the same amplitude and frequency, but with phase θ_2 , is applied to the input. The author derives the general formulae giving the growth and the droop of amplitude

Peculiarities of the passage of phase-telegraphy ... at the selective channel output when the input signal is switched on or off.
 The amplification factor of the n-stage amplifier is:

$$K_n = \frac{K_0^n}{(1 + i \frac{\xi}{d})^n} = K^n e^{-in\varphi} \quad (1)$$

where $K = \frac{K_0}{\sqrt{\xi^2 + d^2}}$ is the one-stage amplifier amplitude characteristic, $\varphi = \arctg \frac{\xi}{d}$ is the phase characteristic, K_0 is the amplification factor with resonance, $\xi = \frac{\omega}{\omega_0} - \frac{\omega_0}{\omega} \approx \frac{2Q}{\omega_0}$ is the relative detuning, and $d = 1/Q$ is the circuit attenuation. A. A. Rizkin [Ref. 2: Osnovy teorii usilitel'nykh skhem (Fundamentals of the amplifier circuit theory) Izd. Sovetskoye Radio, 1958] shows that the transient amplitude in the amplifier described by (1) is (for $K_0 = 1$):

$$A_n(\tau) = \int_0^{\tau} \frac{\xi^{n-1}}{(n-1)!} e^{-(1+\frac{\xi}{d})\xi} d\xi.$$

Card 2/7

29549
S/106/61/000/011/001/006
A055/A127

Peculiarities of the passage of phase-telegraphy ...

After integration, and in the general case, the amplitude of the amplifier output voltage (when a voltage with amplitude U_m inp is applied to the input) can be expressed as follows:

$$U_{nm}(t) = \frac{U_m \text{ inp } K_0^n}{(1 + i\frac{\xi}{d})^n} \left(1 - e^{-(1 + i\frac{\xi}{d})\alpha t} \right) \sum_{k=0}^{n-1} \frac{[(1 + i\frac{\xi}{d})\alpha t]^k}{K!}$$

As to oscillating voltages, taking into account that $\xi = 2\Omega/\omega_0$ and $d = 2\alpha/\omega_0$, the author obtains:

$$U_n(t) = \frac{U_m \text{ inp } K_0^n d^n}{(\sqrt{\xi^2 + d^2})^n} \left\{ \sin(\omega t - n\varphi) - D_n(t) e^{-\alpha t} \sin[\omega_0 t - n\varphi + \psi_n(t)] \right\} \quad (2)$$

where

$$D_n(t) e^{it\psi_n(t)} = \sum_{k=0}^{n-1} \frac{[(1 + i\frac{\xi}{d})\alpha t]^k}{K!} \quad (2')$$

When the external voltage is switched off, the decaying oscillations at the output

but will be:

$$U_n(t) = \frac{U_m \sin K_0^n d^n}{(\sqrt{\epsilon^2 + d^2})^n} D_n(t) e^{-\alpha t} \sin [\omega_0 t - n\varphi + \psi_n(t)]. \quad (3)$$

The author examines now the transient process at a 180° phase-jump. Decaying oscillations $U_{n1}(t)$ with phase $\theta_1 = 0^\circ$ and growing oscillations $U_{n2}(t)$ with phase $\theta_2 = 180^\circ$ take place in this case. Omitting the initial phase $n\varphi$, assuming that $\omega = \omega_0 + \Omega$ he writes $U_n(t)$ as follows:

$$U_n(t) = U_{n1}(t) + U_{n2}(t) = C_n(t) \sin [\omega t + \theta_n(t)] \quad (4)$$

where $C_n(t)$ is the amplitude and $\theta_n(t)$ the phase of the resulting oscillations.

The author obtains finally the following formulae (where $\alpha' = \sqrt{1 + \frac{\Omega^2}{\omega^2}}$):

$$C_n(t) = C_n \sqrt{1 - 4 D_n(t) e^{-\alpha_n t} \cos [\Omega t - \psi_n(t)] - 4 D_n^2(t) e^{-2\alpha_n t}} \quad (9)$$

and

$$\theta_n(t) = \arctg \frac{2 D_n(t) e^{-\alpha_n t} \sin [\Omega t - \psi_n(t)]}{1 - 2 D_n(t) e^{-\alpha_n t} \cos [\Omega t - \psi_n(t)]} \quad (10)$$

29549
S/106/61/000/011/001/006
A055/A127

Peculiarities of the passage of phase-telegraphy ...

In these formulae:

$$D_n(t) = \sqrt{\frac{1 + \sum_{m=0}^{\infty} \frac{(-1)^m \varphi_n^{2m}}{(2m)!} \sum_{k=1}^{n-1} \frac{(\alpha'_n t)^k}{k!} k^{2m}}{1 + \sum_{m=0}^{\infty} \frac{\varphi_n^{2m+1}}{(2m+1)!} \sum_{k=1}^{n-1} \frac{(\alpha'_n t)^k}{k!} k^{2m+1}}} \quad (11)$$

$$\psi_n(t) = \arctg \frac{\sum_{m=0}^{\infty} \frac{\varphi_n^{2m+1}}{(2m+1)!} \sum_{k=1}^{n-1} \frac{(\alpha'_n t)^k}{k!} k^{2m+1}}{1 + \sum_{m=0}^{\infty} \frac{(-1)^m \varphi_n^{2m}}{(2m)!} \sum_{k=1}^{n-1} \frac{(\alpha'_n t)^k}{k!} k^{2m}} \quad (12)$$

S/106/61/000/011/001/006
Peculiarities of the passage of phase-telegraphy ... A055/A127

The author then writes formulae (9) to (12) such as they are when: 1) the signal passes through the amplifier channel without detuning; 2) the signal passes through the amplifier channel with a detuning corresponding to the amplifier pass-band limit, calculated at level $0.707 C_m$. In both these cases the author considers separately the particular cases of one-stage, two-stage and three-stage amplifiers, and draws the following conclusions: 1) When the signal passes through the selective channel of a receiver, the sudden or jump-like nature of the phase variation is preserved only when there is no detuning. The signal amplitude at the moment of the phase change-over is equal to zero. 2) In the presence of a detuning, the phase of the signal varies evenly; as the detuning increases, the phase variation rate decreases. The "valleys" in the signal amplitude decrease also; at great detunings, "overshoots" take place, exceeding the steady value. 3) An increase in the number of stages n , the passband remaining constant, causes only a very slight variation in the features of the transients; the magnitude of the "valleys" and "overshoots" does not vary. 4) Changing the sign of the detuning does not affect the variation features of the amplitude and phase of the signal, while the sign of phase change is inverted. There are 7 figures and 2

TITLE:

Pressure of Saturated Vapor of Solid Zinc- and Cadmium Selenide

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1960, Vol 5, Nr 2, pp 241-245,
(USSR)

ABSTRACT:

It was the purpose of this paper to obtain data on the behavior of ZnSe and CdSe since they are not available in publications. These substances might in future play a part in the transformation of nuclear energy into electric energy, as photo-multipliers, etc. The authors describe the preparation of the selenides from Ts-0 zinc (GOST-3640-47), Kg-0 cadmium (GOST-1467-42), and selenium, especially used for rectifiers (GOST-6738-53) by fusing them together in quartz vials in a stoichiometric ratio. Since the molten components do not mix, and the strongly exothermal reaction takes place only in the gaseous phase, and on the interface at temperatures near the melting point, explosions of the vials occurred frequently so that it was necessary to operate with small quantities. Tables 1 and 2 give the analyses of the resultant selenides. ZnSe was ob-

tained only in the cubic modification of the sphalerite type,
CdSe only in the hexagonal modification of the wurtzite type.
Analysis and radiograms confirmed that the sublimation takes
place without decomposition. The vapor pressure was determined
according to the method described in reference 8, and according
to Knudsen (Tables 4,5). Table 3 gives the calibration of the
effusion chamber by means of KCl vapor. Figure 1 shows the
linear dependence of $\log p$ on $\frac{1}{T}$. The following sublimation
heats were determined: $\Delta H_{\text{subl ZnSe}} = 65.0 \text{ kcal/mol}$;
 $\Delta H_{\text{subl CdSe}} = 50.1 \text{ kcal/mol}$. The authors quote a paper by
N. A. Goryunova (Ref 4), and express their gratitude to
Yu. P. Simanov for advice in evaluating the radiograms. There
are 1 figure, 5 tables, and 10 references, 6 of which are Soviet.

AUTHORS: Sokolov, V.V., Pelekhatty, M.I.

TITLE: On transient processes in resonant systems with phase keying

PERIODICAL: Elektrosvyaz', no. 4, 1963, 33 - 38

TEXT: Formulae are derived for the transient amplitude and phase at the output of an n-stage resonant amplifier in the general case, i.e., in the case of arbitrary phase jumps and in the presence of a detuning of the resonant system with respect to the incoming signal. The authors examine an n-stage amplifier with single-tuned anode circuits and with the amplification factor

$$K_n = \frac{K_0^n}{(1 + i \frac{\epsilon}{d})^n} = K^n e^{-in\varphi}, \quad (1)$$

where $K = \frac{K_0 d}{\sqrt{\epsilon^2 + d^2}}$ is the amplitude characteristic of a single-stage amplifier, $\varphi = \arctg \frac{\epsilon}{d}$ is the phase characteristic, $\epsilon \approx \frac{2Q}{\omega}$ is the relative detuning

Card 1/4

S/106/63/000/004/005/008

A055/A126

On transient processes in resonant systems

and d is the attenuation of the circuit. The resultant signal at the amplifier output (when the input signal phase jump is $\Delta\theta = \theta_2 - \theta_1$) is considered as the sum of the residual oscillations (after the switching out of the input voltage with phase θ_1) and the rising oscillations (after the switching in of an input voltage with the same amplitude and frequency, but with phase θ_2). Omitting the initial phase $n\varphi$ and assuming that the detuning is positive, the amplitude of the resultant oscillations is

$$C_n(t) = \frac{u_{m0} e^{-at}}{(V^2 + d^2)^n} \times \sqrt{1 - 4D_n(t) e^{-at} \sin \frac{\Delta\theta}{2} \sin [\Omega t - \psi_n(t) + \frac{\Delta\theta}{2}] + 4D_n^2(t) e^{-2at} \sin^2 \frac{\Delta\theta}{2}}, \quad (3)$$

and the phase of the resultant oscillations is

$$\theta_n(t) = \arctg \frac{\sin \theta_2 - 2D_n(t) e^{-at} \sin \frac{\Delta\theta}{2} \cos [\Omega t - \psi_n(t) - \frac{\theta_1 + \theta_2}{2}]}{\cos \theta_2 - 2D_n(t) e^{-at} \sin \frac{\Delta\theta}{2} \sin [\Omega t - \psi_n(t) - \frac{\theta_1 + \theta_2}{2}]}, \quad (4)$$
