15. Automatization of steam boiler plants of power stations. -- A gozkazanuzem automatizatasa eromuvekben -- by M. Stein. (Power Economy in Hungary -- Magyar Energiagazdasag -- Vol. IV. Nos. 4, 6, pp. 104--110, 193--199, April, June 1951, 7 figs.)

The automatic control of steam boilers in power plants is extremely important from an economic point of view. The losses occurring due to the fall of pressure and temperature of the steam can be demonstrated by means of the entropy diagram. These losses can be substantially reduced by automatic firing and temperature control, since the pressure and the temperature of the superheated steam can be kept approximately constant by control devices. In addition to improving the efficiency of the power engine operated by controlled steam, the increased load capacity also contributes to the improvement of the total efficiency of the units connected to the national mains. The possibilities for economy are illustrated by numerical examples worked out for condensation and back-pressure plants. By the correct automatization of the feed regulator, the water space of the boilers can be used for damping shocks due to the drawing off of steam. The important advantage of all automatic controls over manual controls lies in their instantaneous reaction.

Title: New Fat Hydrolysis Methods

Original

Publication: Rev. ind. aliment. prod. vegetale, 1956, No 3, 12-13

Abstract: Enumeration of modern methods for the hydrolysis of fats at more or less elevated temperature and pressure, with or without the use of catalysts. It is reported that fatty acids obtained as a result of hydrolysis at high temperature can be utilized in the manufacture of cosmetic soap.

Title :

Some Defects in Quality Noted in the Manufacture of
Household Soap and Procedures for Their Elimination.

Orig Pub : Rev. ind. aliment. prod. vegetale, 1956, No 12, 14-15

Abstract : Exudations which are observed on storage of household
soap made from low-titer fatty acids are eliminated by
addition of Na_2SiO_3 , talc and bentonite. The formation
of dark spots on such a soap, and its rancidity are pre-
vented as follows: in the case of soap intended for pro-
longed storage -- by omitting from the formula liquid,
technical, vegetable oils, and in other soap -- by redu-
cing their amount to 20% or by substituting cottonseed

chanizmem nerwowej regulacji leukocytozy. Further investigations on the
nervous regulation of leucocytosis NEUROI. NEUROCHEM. I PSYCHIAT. POLSKA (Warszawa)
1952, 2/6 (653-666) Graphs 2*

Having found previously that in animals in amytal-narcosis or with the spinal cord cut through a C 7 post-bacterial leucocytosis is in many cases inhibited in spite of an increased leucopoiesis as proved by the leukergy test, the authors studied the influence of adrenaline on leucocytosis and leukergy in narcotised and waking rabbits. The action of adrenaline shows in normal animals two phases, in the first it mobilises the leucocytes from the deposits, in the second it stimulates the leucopoiesis. This is proved by lack of leukergy in the leucocytosis of the first phase and its presence in the second. The response of narcotised (amytal) animals is equal in principle, but owing to the lessened vasoconstrictor tonus in narcosis, the first reaction is delayed, the second less distinct than in waking animals. The lack of peripheral leucocytosis is at least in part due to the stagnation in blood deposits resulting from a deficiency of central nervous influences working mainly through the vasomotor system. The inhibition of leucocytosis can be checked partially and for a short time by the use of adrenaline, working mainly peripherally. Experiments on splenectomised animals show that the spleen plays a small role as blood deposit, the leucocytes being accumulated mainly in the lungs, as found by puncture. Author

907. THE MIDDLEBROOK-DUBOS TEST AND THE COOMBS TEST DURING TUBERCULOUS MENINGITIS - Badania nad występowaniem odczynu hemaglutynacyjnego Middlebrooka i Dubosa oraz odczynu Coombsa w przebiegu gruźliczego zapalenia opon i mózgu - Stein W. and Tuszkiewiczowa M. Klin. Chor. Nerw. Akad. Med., Lublin - ANN. UNIV. LUBLIN. SECT. D 1956, 11 (77-104) Tables 16

In a series of 12 cases of sure diagnosis and 3 probable cases tests were repeatedly performed in the CSF and in the blood serum. The results were inconstant and no clear relation with the cell-count and albumin content of the CSF could be found. In some positive cases the titre of CSF fell with the developing remission, that of the blood serum remained rather high. The antibodies looked for were in some cases found first in the blood, but oftener appeared simultaneously in both media. The serum titre regularly surpassed that of the CSF. Some sure cases yielded negative results. In probable cases in which neither signs of tuberculous infection nor a positive CSF culture supported the diagnosis, serially positive serological tests plead for a tuberculous process. In spite of the low titre and of its late turning positive, the antibodies of the CSF are thought to be partly of local origin. This view is based on the experimental studies published in the literature on the subject, which concern various antigens and the nature of the luetic reagins of the CSF.

1486. ELECTROENCEPHALOGRAPHIC INVESTIGATIONS IN NOCTURNAL ENURESIS IN SOLDIERS - Badania elektroencefalograficzne w moczeniu nocnym zolnierzy - Stein W. and Domzal T. Odd. Chor. Nerw. Centr. Wojsk. Szpit. Klin., Lodz - NEUROL. NEUROCHIR. PSYCHIAT. - POL. 1957, 7/6 (981-985)

EEG examination was performed in 50 soldiers aged 20-23 yr., affected with enuresis nocturna. In 10 of them X-ray examination showed spina bifida in the lumbosacral spine. There was no correlation found between the EEG pattern and spina bifida. Epileptic recordings were not found; however, in most of the records some slow waves (5-7 c.p.s.) were present, particularly in the cases enuretic since childhood. This data support the hypothesis of the immaturity of the nervous system in cases of enuresis nocturna. (VIII, 19)

"Lipid Metabolism and the Overstrain of CNS (A Study of Telephone Operators) Summary."

Prague, Activitas Nervosa Superior, Vol 5, No 4, 1963, p 403

Abstract: Numerous studies of neurosis occurring in telephone operators were made. Their work is performed under conditions of nervous strain. Lipid metabolism and its possible role in the pathogenesis of arterosclerosis was studied. Lipid values before work and after 3 hours were compared. Cholesterolemia, the lipoprotein ratio and Kunkel test with Formol were made.

Biochemical indices did not differ significantly from those in the control group (sanitary workers); the 3 hours did not result in clear changes in the lipid metabolism. No relation was found between the length of service and the blood cholesterol level. No references. Submitted at the Medical Congress in Prague, November 1962.

TITLE: The remote control of a repeater station

PERIODICAL: Przegląd telekomunikacyjny, no. 1, 1962, 12-14

TEXT: A coding system is described which was used for control of remote repeater stations. This system was developed by the State Teletransmission Establishment. The remote controlling station governs up to 10 telemetering stations connected into a line, in one direction or in two opposite directions. The controlling capacity is up to 10 objectives and 24 signals for each of the 10 remotely controlled stations. For code transmission, two acoustic lines of 200 and 800 ohms were used. One line was used for calling and driving the remotely controlled station, the other for reporting and signalling. Each of the 10 remote stations can receive 20 commands (on or off for 10 objectives) and return 68 reports. These reports refer to the state of the remote station, state of

TITLE: Effect of the scattering of gamma and X-rays on the dimensioning of shielding

PERIODICAL: Tehnika, no. 11, 1962, 2129-2136

TEXT: A survey is given of the available information in this field. The author discusses first the case of narrow monoenergetic gamma and X-ray beams, dealing successively with the measurement of the total attenuation of intensity on passing across matter, the cross-section, the linear total attenuation factor, the calculation of total attenuation, the mass factor of total attenuation, and the shares of the effect of individual reactions (Compton effect, pair formation, Rayleigh scattering, nuclear photoeffect, bremsstrahlung) on the value of total attenuation. When discussing the broad monoenergetic beams, the author deals with the build-up factor in general and for the intensity, dose and energy, and finally with differences in the definitions of this factor, and some

TITLE: Determination of nickel film thickness on nickel-clad steel strip

SOURCE: Hutnik, no. 1, 1967, 10-15

TOPIC TAGS: nickel film, nickel plating, nickel plate, nickel, nickel-clad steel strip, thin nickel film

ABSTRACT: The electronic industry requires a uniform 10-micron thickness of the nickel film on 0.15-mm carbon steel strip nickel-clad on both sides. Studies at the Baildon Steel Works for developing a method to measure such films accurately, undertaken in cooperation with the Chair of Metallurgy and Heat Treatment, Academy of Mining and Metallurgy, were concluded in 1965. The film thickness was determined by the "jet-time," microscope, and chemical methods on microsections of
