TITLE: The measurement of certain parameters of the acceleration pulse

SOURCE: Avtometriya, no. 1, 1966, 100-102

TOPIC TAGS: acceleration measurement, electronic circuit, pulse analyzer

ABSTRACT: In the measurement of shock acceleration, the entire shape of the applied impulse is usually not registered; the registration is confined only to certain parameters sufficient for particular practical purposes (thus relieving some of the strain imposed on communication channels). When the acceleration pulse is smooth, its maximum value and duration may be registered. For the case of nonmonotonic pulses, the author proposes the use of the average value of the pulse as a substitute characteristic parameter. The determination of the average can be carried out by a circuit, proposed earlier by the author (Pribor dlya izmereniya udarnykh uskorenii, Peredovoy nauchno-tehnicheskiy i proizvodstvennyy opyt, M., TsITEIN, 1962, No P-62-18/4) which determines simultaneously the average value of the pulse and its duration. This information is supplemented by the measurement of the maximum of the pulse carried out by a circuit shown in Fig. 1. Orig. art. has: 3 formulas and 2 figures.

Interactions of endoplasm and ectoplasm of meningeal cells
induced by action of harmful agents. M. A. Subbotin (Z. R. Acad.
Sci. U.S.S.R. 1953, 59, 1147-1150). In rabbit peritoneal men-
ingeal cells, in which hematoxylin staining does not normally
distinguish endoplasm from ectoplasm, a clear distinction is found
when endoplasm more darkly stained 2 hr. after introducing harmful
agents (5% "adenozine" or 1% "Berlin blue") into the peritoneal
cavities. After 24 hr. the darkly stained "endoplasm" is found to be
broken up into granules and threads spread throughout the whole
ectoplasm. G. S. DAWLEY.

Abstract : After administration of trypan blue and lithium carmine to pregnant female rabbits and rats, a study was conducted on the distribution of these staining agents in different types of placental cell elements. In the placental cytotrophoblast of rats and rabbits trypan blue and lithium carmine are not deposited at all or very tiny granules of these staining agents are noted. It is characteristic of syncytial trophoblasts of all sections of the placenta that abundant deposits of small intensely

Title: Inot: Excretory Function of Placental Epithelium.

Original: Rytul. eksperim. biol. i meditsiny, 1957, no 1, 118-120

Abstract:

A 1% solution of indigo Carmine was introduced into the tissues of rabbits' and white rats' fetuses, and a study was made of its distribution in the placental (?) trophoblast and in the omphalopleura at different stages of the second half of pregnancy. Excretion was observed of Indigo Carmine by chorial F syncytiots into the maternal organism's blood. Indigo Carmine was found in a smaller quantity in the epithelium of the P yolk. Similar results were obtained in the application of the xanthidric reaction (Shtubei method) on urea. Excretion of fetal metabolic products is accomplished by chorial trophoblast or the allantoicidal F,

The article gives a comparative analysis of the clinical course of nephropathy and histochemical changes of the placenta in 35 parturients affected with nephropathy. The content of highly polymeric acid mucopolysaccharides in the connective tissue stroma of chorionic villi increases with the severity of the illness. An especially large quantity of highly polymeric mucopolysaccharides (hyaluronic acid in particular) is seen in the stroma of chorionic villi in severe forms of nephropathy; the mucopolysaccharides are revealed in all villi near infarctions, in the form of coarse granular fibrous formations, thickly interlaced.

TITLE: Some problems of quantum biology and problems of information transmission
in biologic systems

SOURCE: Avtometriya, no. 2, 1965, 3-10

TOPIC TAGS: biology, quantum theory, tissue physiology, cell physiology, information storage and retrieval, information theory, data transmission, photon, blood

ABSTRACT: Theoretical prerequisites for information transmission in biologic systems by means of quantum fluxes are given. The ultraweak luminosity of blood and a nerve is recorded with a photon counter. The problem includes mechanisms for coding various factors of the medium in quantum fluxes and recording this information in chemical structures and mechanisms for retrieving the recorded quantum information from the chemical structures and utilizing this information in enzymatic-synthetic processes. Comparison of data on physics, chemistry, and information theory with experiments in mitogenetic research indicates the possibility of the existence of a highly efficient system of information transmission

Card 1/2

in biologic systems with a rate of about 10^{20} bits/sec per watt of consumed energy; the possibility of coding this information in chemical structures of varying complexity; and the possibility of effective conversion of this information to electric signals. The effect of one tissue culture on the growth of another through quartz glass is shown. Possible ways of using the mechanism of quantum information in technical devices are shown.

SOV/118-59-2-15/26

AUTHOR: Subbotin, N.P., Engineer

TITLE: In Textile Plants of the Ivanovo Sovnarkhoz (Na tek-stil'nykh fabrikakh Ivanovskogo sovnarkhoza)

PERIODICAL: Mekhanizatsiya i avtomatzatsiya proizvodstva, 1959, Nr 2, pp 44-47 (USSR)

ABSTRACT: The author deals with the mechanization level achieved in the textile enterprises of the Ivanovo Sovnarkhoz. During recent years, a high mechanization standard has been reached with 25 km of ropeways built. Some enterprises have introduced continuous transportation means (conveyers, transporters, etc). The use of pneumo-transportation is spreading, and various new kinds of equipment have been introduced (truck-mounted and electric loaders, trolley cars, electric platform trucks, etc). The Ivanovskiy melanzhevyy kombinat (the Ivanovo Melange Combine) uses electric trains for the stacking and transportation of cotton bales. At the beginning of 1958, 1,100 workers lost their jobs due to new mechanization methods. The mechanization level, however,

Card 1/5

SCV/118-59-2-15/26

In Textile Plants of the Ivanovo Sovnarkhoz

is still low. The mechanization of transportation operations e.g. affects only 15-40%. The Fabrika "Krasnaya Talka" ("Krasnaya Talka" Plant) uses a narrow-gage platform with cable drive for the transportation of cotton bales, and the plants imeni Balashov and "Krasnaya vetka" use electric cars of the EK-2 type. Other plants use special carriages with dump trays. The Furmanovskaya fabrika No 2 (Furmanov Plant Nr 2) uses monorail ropeways, designed by Giprotekstil'-prom, balance gears, dragging devices, double-chain elevators, trolley conveyors, etc. A ropeway with cradle is used at the Furmanov Plant Nr 2 for the removal of canvas. The Plant imeni Nogin and the Ivanovo Melange Combine use an electric tow car coupled with suspension carriages. Ardamakov from the Kineshems-kaya fabrika Nr 2 (Kineshma Plant Nr 2) has invented an automatic device, removing tops from spinning machine spindles within 30 seconds. The Ivanovo Sov-narkhoz has decided to equip 50 spinning machines with

Card 2/5

SOV/118-59-2-15/26

In Textile Plants of the Ivanovo Sovnarkhoz

this device. The "Krasnaya vetka" Plant has developed a mechanized installation for the loading of yarn into railroad containers instead of wooden boxes. The enterprises of the Upravleniye khlopchatobumazhnoy promyshlennosti Ivanovskogo sovnarkhoza (Cotton Industry Management of the Ivanovo Sovnarkhoz) have 63.5 % of their spinning machines equipped with staple-catchers (mychkoulovitel'). In some plants ("Krasnaya talka", imeni Varentsova, imeni Dzerzhinskiy and Novo-Gorkinskij) all spinning machines are equipped with staple-catchers. Several plants have introduced automatic dust blowers. For hoisting and moving warping spindles, monorail ropeways with electric telphers or chain pulley blocks are used. The Ivanovo Melange Combine uses the re-equipped 4004 battery loader with trailers for transportation (as prime mover). Existing mechanical spinning machines are being successively replaced by automatic machines. Some plants have introduced air conditioning. The most interesting recent innovations

Card 3/5

SOV/118-59-2-15/26

In Textile Plants of the Ivanovo Sovnarkhoz

are: a mechanized chemical installation at the Tsekhanotdel'ki vel'vetkorda na Rodnikovskom melanzhevom kombinate (Velveteen Cord Finishing Plant of the Rodniki Melange Combine) for the manufacturing of dye solutions; a rotary belt conveyer for the transportation of raw material at the Fabrika im. rabochego Fedora Zinov'yeva (Plant imeni the Worker Fedor Zinov'yev); a hydraulic elevator at the BIM Plant; and container centers at the Teykovskiy (Teykovo) and Rodniki Combines for forwarding finished products. For feeding boilers, removing slag, loading and unloading lumber, wood waste, peat, etc, electric telphers, pneumatic devices, belt conveyers, grab cranes, ropeways, etc, are used. A suspension railroad (according to the project of Giprotekstil'prom) has been installed at the Ivanovo Melange Combine and furnished with electric telphers TV-1, pneumatic switch and a hanging scales

Card 4/5

SOV/118-59-2-15/26

In Textile Plants of the Ivanovo Sovnarkhoz

VAM-2. The author also mentions the use of small battery tow cars of ET-1500 type and the electric telpher TV-3. There are 3 diagrams, and 3 photographs.

The preparation of colloidal silicic acid as an active filler for rubber. S. A. Subbotin and A. N. Lukyanchikov. *Sintet. Kaučuk* 1954, No. 1, 34-5. By the action of NaHCO₃ in the presence of Na₂CO₃ on Na silicate a very fine colloidal silicic acid was obtained. With 60% by wt. of this silicic acid in the mixt., Na butadiene rubber (no. S-4, "Rubberax" 3, stearic acid 2.5, diphenylguanidine 1), the tensile strength was 121 kg. per sq. cm., whereas with 65 of gas black in its place the strength was only 82 kg. per sq. cm. The authors suggest using, for the prepn. of silicic acid, the siliceous residue from the manuf. of Al.

A. Pestoff

The resiliency in sodium bivinyl rubber. S. V. Lebedev, S. A. Subbotin and V. F. Evstratov. *Prudnikovskii Opol' Zavoda Sintet. Kaučukha Litera N. III. Sinteticheskii Kaučuk SG-100* (1934). Lamp black, C black, clay, MgO and MgCO₃ improve the properties of Na bivinyl rubber, the improvement decreasing in the order given. ZnO is an inferior filler. Best results with the permanent deformation of the vulcanized Na bivinyl rubber were obtained with C black, MgO and ZnO. The highest permanent deformation of vulcanized rubber was obtained with clay and MgCO₃. A. A. Bochtinguk.

The action of high temperatures on vulcanized sodium butyvinyl rubber. S. V. Lebedev, S. A. Subbotin and G. I. Bugakov. *Trudy Gomzard. Opyt. Zavoda Sintet. Kaučukov, Litera B, T1.* Synthetic Rubber 1955, 72-84.
Changes in Na-butyvinyl rubber after vulcanization are described. It acquires great mech. strength on heating, but loses easily its original elasticity. The temp. limits for these changes are considerably higher than those of natural rubber. Vulcanized Na-butyvinyl rubber is very resistant to oil when heated. With low S the rubber retains its elastic properties on heating. A. A. B.

AUTHOR: Slobotin, S. A.; Zykov, S. K.; Stolyarov, B. V.TITLE: Investigation of inhibited oxidation of octene-2 with molecular oxygen
in the presence of 2,6-ditertiary butyl-4-methyl phenol (ionol)

SOURCE: Zhurnal prikladnoy khimii, v. 36, no. 4, 1963, 870-875

TOPIC TAGS: octene-2, ionol

ABSTRACT: Oxidation reactions were run on octene-2 with molecular O in continuously circulating systems at 80 and 100 degrees with and without antioxidant to explain reaction mechanism, determine activation energy and equilibrium kinetics, and to investigate the behavior of the antioxidant. In the oxidation of octene-2, the O is added at the double bonds and at the C-atom in the alpha-methyl position with respect to the double bond. Activation energy equals 23.3 kcal per mol. The oxidation products are the bright orange stilbene quinoid type compounds, stilbene quinone, and stilbene hydroquinone. Ionol (2,6-ditertiary butyl-4-methyl phenol) decreases, and in proportion of 5% inhibits the induction of oxidation for a substantial time;

USSR/Geophysics - Gravity anomaly

FD-2575

Card 1/1 Pub. 44 - 5/19

Author : Subbotin, S. I.

Title : The connection of the gravity anomaly with the vertical movements
of the Earth's crust

Periodical : Izv. AN SSR, Ser. geofiz, Jul-Aug 55, 332-338

Abstract : The question of the connection of the vertical movements of the
Earth's crust with processes occurring in the submantle is consid-
ered. On the basis of an analysis of the gravity anomaly and of
the amplitudes of deflection and upheaval of rocks, for example,
the Dnepir-Donets Dnieper depression, the Ukrainian crystalline
massif and Carpathian zone, the author came to the conclusion that
the chief cause for the vertical movements of the Earth's crust and
the formation of structural elements named in the work is the proc-
esses of compression (buckling) and expansion (upheaval) of the
submantle substance, so that or its overflow plays a subordinate
role and is not a necessary process, although a possible one.

AUTHOR: Subbotin, S.I.

TITLE: The deep structure of the territory of the Ukrainskaya SSR according to findings of geophysical research

SOURCE: International Geological Congress, 21st, Copenhagen, 1960. Doklady sovetskikh geologov, problema 2: Geologicheskiye res'yaty pri-kladnoy geofiziki i geofiziki. Razdel 11: Geofizika. Gubinnoye stroye-
niye zemli po geofizicheskim dannym, 58-60

TEXT: This article describes the deep structure of the Ukraine and the processes taking place beneath the crust, which are the cause of tectonic dislocations. The Earth's crust in the Ukraine is split by deep fractures in latitudinal, longitudinal, north-easterly and north-westerly directions. Large blocks have moved, and still move, vertically along these fractures. These dislocations are caused by expansion and contraction of the sub-crustal matter, as a result of its polymorphous transformation under high pressures and temperatures, and in turn lead to the formation of the main geotectonic units: the Ukrainian Shield above a zone of expansion; the Dnepr-Bugets, Black Sea Coast, Indolo-Kubanskaya, Ciscarpathian, Trans-Carpatian and Black Sea depressions above a zone of con-

165/311.

The deep structure....

pression; the Dnieper, Carpathian and Crimean folded structures above the zones where the two processes have been combined. Large faults occurring at great depths in the crust determine the distribution of minerals: oil and fuel gas in the Carpathian zone and Dnieper-Donets and Black Sea Coast depressions; ore deposits in the Ukrainian shield; sulphur, where the Russian Platform adjoins the Cis-Carpathian depression. Further research in the Ukraine must be directed at finding other deep faults and at establishing the relationships between them and the structure of the upper parts of the crust, including deposits of useful minerals. There is mention of the writings of A.V. Feyve, K.S. Slatckiy (Ref. 29: 6) [rozdil-2] i Pachinkskaya proizba.
