Title : On the Knowledge of Fauna of Coccidia of the  
Rodents of Central Kazakhstan.

Orig Pub: Tr. In-ta zool. AN KazSSR, 1958, 9, 183-186.

Abstract: The intestinal content of 66 Mongolian conies and 43 Strel'tsov's mice (Microtus) were investigated for Coccidia according to Darling's method; of these, 26 (39.4%) conies and 4 (9.3%) mice were found to be infected. A description and the dimensions are given of the oocysts of the discovered species of Coccidia, viz., Eimeria kriyasmanni, E. erschovi, E. musculi, E. arvicolae and Eimeria sp., are given.

Abstract: In roe deer and Saiga tartarica antelope, new species of Coccidia were discovered (in the former, Isospora capreoli and in the latter, Eimeria saiga). In new hosts, 6 already-known species of Coccidia were discovered: E. scabra and E. deb-liecki in wild boar, E. ninae kohl-jakimov in Gazella subgutturosa and Central Asian goat, E. intricata in Ovis argali, E. parva in Central Asian

503. SOME DYSPHATIC DISORDERS OF CHILDREN IN CONNECTION WITH THE PROBLEMS OF FUNCTIONAL ASYMMETRY - Některé dysfatické poruchy u dětí v souvislosti s problémy funkční asymetrie - Švancarz, J. Neurol.-Psychiat. Odd. Krajské Dětské Nem., Brno - ČSL. NEUROLOG. 1957, 20/1 (32-38) Illus. 3

Sensitive psychological methods are described in order to establish the range of functional disorders within the sphere of some analysors in cases of predominance of the right hemisphere. Clinical casuistics point to a neurotic superstructure in left-handed children. Personal experience shows that the majority of neurotic disorders are temporary and that they can be avoided or improved by proper didactical and paedagogical procedures. Neurotic manifestations of left-handed persons arise as a result of enforced training of the right hand. With regard to the demands of every-day life it is necessary to train left-handed persons in ambidexterity. Cases requiring individual solution in this respect are rare.

TITLE: Dynamics of intellectual deficiency in children with localized and diffuse CNS damage

SOURCE: Activitas nervosa superior, v. 7, no. 2, 1965, 145-146

TOPIC TAGS: central nervous system, brain, tumor, man, behavior pattern, encephalitis

ABSTRACT: Effects of a localized organic CNS damage in children's motor coordination, intellectual performance, and personality are discussed. 78 children aged 3-15 years with brain tumors, and 34 with subacute leucoencephalitis were examined. Intellectual deficiency in diffuse and localized brain damage at various age levels was studied. Mental development relating to the causes of the disease was investigated, and a mathematical model of intellectual deterioration in these 2 cases was studied. It could not be confirmed that the intellectual deficiency increases with age. In cerebral neoplasms mental development is below standard. No difference in the mental state was due to the supratentorial or infratentorial location of the tumor. Leucoencephalitis causes rapid deterioration at any age. The mathematical regression model allows the computation of a mental age. It also allows diagnostic deductions in some brain diseases. [JPRS]

Title : Winter Bees Are the Most Long-Lived Bees (Zimniye pchely-naiboleye dolgovechnyye pchely)

Orig Pub: Vcelarstvi, 1956, 9, No 9, 131-132

Abstract: The honey bees which were receiving feed supplement of pollen lived in the cells 48-66 days (maximum 111 days); and the control ones which were receiving only carbohydrate food lasted but 25-28 days (maximum 37 days). Much lesser difference in the longevity of bees in the cells could be observed when winter bees which lived in the hive for a long time were receiving the feed supplement; those receiving beebread lived 40-42 days (maximum 76 days), and the control ones lasted for 38 days (maximum 76 days).

Cracked nipples occur in 20% of puerperal women. Freshly prepared gramicidin ointment in lanolin (5 ml. per 100) was used for treatment of 260 cases. Rapid healing of fissures was noted; at the time of discharge the fissures had completely healed in 254 patients (90.6%). Parallely, material from the cracks was cultured (46). Beginning from the 3rd or 4th day of treatment the cultures remained sterile in 89.2% of cases. (S)

TITLE: A Diagram of Water Power Balance in the Complex Utilization of Discharge (Epyura odnoenergeticheskogo balansa pri kompleksnom ispol'zovanii stoka)

PERIODICAL: Gidrotekhnicheskoye Stroitel'stvo, 1958, Nr 5, pp 41-44 (USSR)

ABSTRACT: As hydrotechnical constructions grow and the utilization of water resources increase, the more complicated becomes the interrelation between separate water engineering objects. Under these conditions, it is therefore very important to study the water balance of every construction phase in the whole territory which belongs to a certain water economy system. The following Soviet scientists worked out a diagram on the problem of water power and water supply: R.Zh. Zhulayev, N.S. Kalachev, N.N. Abramov, M.A. Mostkov, O.Sh. Kokochashvila and others. The recommended water power diagram illustrates the utilization conditions of water and water power resources for a separate water economy object or for a water economy system as a whole. The diagram gives a comparison of the

by the action of tissue extracts. G. D. Tumanishvili,  
K. M. Dzhandieri, and I. K. Svanidze. *Doklady Akad.  
Nauk S.S.S.R.* 106, 1107-9(1953). -- Exts. of liver and heart  
tissues of immature chicks were made with 0.9% NaCl, and  
the exts. were introduced into the embryos near the vascular  
area. After 1-3 days the embryos were examd. for wt. of  
the respective organs. The embryos ranged from 6 to 15  
days. The results with liver growth were consistently pos.,  
although weak with older specimens. A pos. effect was also  
obtained with 10-15-day specimens in case of heart ext.  
The stimulating effect of the ext. vanished on heating the  
ext. to 60-90° or on keeping several hrs. at 10-18° or in the  
cold 3-5 days. The effect is thus connected with thermo-  
labile protein matter.

TITLE: Peculiarities in the Development of the Optic Nerve and of the Retina of the Rock Lizard (Osobennosti razvitiya zritel'nogo nerva i setchatki skalistoy yashcheritsy)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 3, pp 703 - 704 (USSR)

ABSTRACT: The author analyzes the material concerning the histogenesis of the eye of the rock lizard (*Lacerta saxicola*). The differentiation of the inner germ of the embryonal eye of this lizard proceeds irregularly. This differentiation described here in detail determines the character of development of the optic nerve. The data found by the author let suppose that the mentioned heterochrony in the differentiation of the inner germ gives proof of the phylogenetic ancientness of this field of receivers. The participation of the cells of the area of the inner germ near the pedicellus in the formation of the glial basis of the optic nerve is evidently explained by a common formation source of the astrocyt glia and of the oligodendroglia of the optic nerve and of the Müller fiber of the

TITLE: Morphological and cytochemical characteristics of retinal and visual cortex cells at the time of postnatal opening of the eyes in mammals

SOURCE: AN GruzSSR. Institut fiziologii. Trudy, v. 14, 1965. Sovremennyye problemy deyatel'nosti i stroeniya tsentral'noy nervnoy sistemy (Present problems of the activity and structure of the central nervous system), 199-211.

TOPIC TAGS: retina, visual cortex, rod, cone, visual rod, visual cone, retinal rod, retinal cone, visual analyzer, visual physiology, S. group, visual pigment, photoreceptor

ABSTRACT: The structural characteristics of the retina and visual cortex were studied in the newborn of several mammals (rats, rabbits, cats, and dogs) 24 hr before and 24 hr after opening of the eyes. The results show that opening of the eyes may occur while the process of differentiation of the various parts of the retina is still going on, at a point when the cell mass is still not completely differentiated into  
Card 1/2

L 22210-66

ACC NR: AT5024238

the inner and outer layers of the nucleus and while the cambium cells of the retina are still dividing. The visual cortex at the moment of opening of the eyes is characterized by incomplete development of pyramidal and stellate dendrites. Cytophotometric data show the SH-groups of the retina and visual cortex to be concentrated in the rods and cones 24 hr before opening of the eyes. After the opening of the eyes, light stimulation causes a sharp increase in the number of SH-groups in all retinal and cortical elements of the visual analyzer (differentiated photoreceptors, bipolar and ganglion cells of the retina, and individual pyramidal neurons of the 4th layer of the visual cortex). This increase in the number of SH-groups in the visual analyzer but outside the rods and cones during the 24 hr after opening of the eyes must be accomplished with the help of SH-groups not bound to visual pigments.
