occupational accident rate PRACOVNÍ LÉKAŘSTVÍ (Praha) 1956,  
8/5 (341-349) Graphs 4 Tables 6 Illus. 3

The problem of accident prevention is divided into technical and organizational, public health and medical, and completed by the trade-union education of the employees for safe and healthy work. Recording of the incidence of accidents and morbidity on IBM punch-cards and their elaboration in the mechanical calculating centre, which makes the following statistical computations, is described: the list of all new accidents in the month, both occupational and non-occupational, workers and clerks being listed separately; a list stating the commencement of working incapacity due to accidents; a list stating the termination of working incapacity due to accidents. By analysis of the accident rate according to the number of years of employment, in the factory the conclusion is arrived at that 57 to 68% of all accidents affect employees working in the factory for less than 5 yr. It is a problem of new and young employees. Young employees up to 16 yr. constitute from 20 to 26% of the total accident rate. A detailed analysis is given of the accident rate in rolling-mills for one month. Establishment and evaluation of the causes of accidents is the most difficult part of the morbidity analysis. The term 'own fault' which does not explain anything and hinders the campaign against accidents is rejected. On the basis of the authors' own and the Soviet experience, a new classification of causes of accidents is presented. A unified classification of accident causes cannot be established for all accidents, and the classification must be differentiated for accidents associated with work, sports, youth, etc.

TITLE: Liver damage in the course of phenothiazine treatment [This paper was presented at the 7th Annual Psychopharmacological Meeting, Jesenik, 20-23 January 1965]

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 250

TOPIC TAGS: liver, pharmacology, drug treatment

ABSTRACT: 4,100 patients were examined in the period 1961-64. 46.2% of the psychiatric patients were treated with phenothiazine ataractics. 93 instances of liver disease were found; of these 13 cases were found after administration of phenothiazines. This corresponds to an incidence of 6 per 1000 phenothiazine-treated patients. Of the 13 cases 11 were icteric and 2 anicteric. The 2 anicteric cases returned to a normal state 19-31 days after the withdrawal of the drug; in the icteric cases jaundice disappeared in 6 to 59 days after the drug was withdrawn, but only in 4 did the liver return to normal functioning. The course of the disease was in all cases benign with one exception; this was controlled with corticoid treatment and the intestine was sterilized with Neomycine. [Orig. art. in Eng.] [JRS]

\*Use of Compounds in Chemical Analysis. V.—The Chromometric Determination of Trivalent Cobalt. R. Pribil and L. Švestka (*Coll. Traç. Chim. Tchecoslov.*, 1950, **15**, (1/2), 31-41).—[In English]. Cf. *ibid.*, 1949, **14**, (8/10), 444; *Met. Abstr.*, 1949-50, **17**, 839. A solution in very dil. HCl of Co and ethylenediamine tetra-acetic acid is oxidized by heating at 100° C. with  $K_2Cr_2O_7$ . The solution is diluted, made more acid, and excess  $K_2Cr_2O_7$  reduced with  $Na_2SO_3$  which does not affect the  $Co^{III}$  complex. The Co is then titrated potentiometrically in an inert atmosphere with  $CrCl_3$ . Mn, Ni, Zn, Cr, and Al do not interfere.—F. M. L.

"Clinical Experience with Proheptatrine VUFB."

Prague, Activitas Nervosa Suncrior, Vol 8, No 4, Nov 66, pp365-366

Abstract: Proheptatriene was administered to 32 patients suffering from depression; the treatment was continued for 4 weeks. In 5 cases the treatment had to be discontinued because of an aggravation of the somatic state. A substantial improvement was achieved in 5 patients, slight in 9, and moderate in 5. 13 patients did not improve. Undesirable side effects appeared in 14 patients. The effect of the drug appeared within the first week of treatment. The clinical effect of the drug resembles that of amitriptyline. Apart from its antidepressive action, it also has a sedative and hypnotic action. Because of its quick action it is suitable for treatment of non-hospitalized patients. 1 Figure, no references. Submitted at the 8th Annual Psychopharmacological Meeting at Jesenik on 18 - 22 Jan 66, Article is in English.

2485. Determination of labile sulphur in phosphogelatin. Svestka, T. *Vestn. belg. i fil'mov. Tekhn.*, 1953, 6 (5-6), 81-91; *Reprint. v zh. Khim.*, 1954, Abstr. No. 46,865. The following methods for the determination of organically combined S in gelatin are compared: (i) Sheppard and Hildson (*Ind. Eng. Chem., Ind.*, 1930, 4, 73-74); (ii) Steigmann (*Sov. Ind. Photoogr.*, 1949, 20, 918-919); (iii) Abriloff (*Sov. Ind. Photoogr.*, 1941, 12, 1). The third is the most accurate; this is based on reaction of the labile S with ammonical soln. of  $\text{AgNO}_3$  to form  $\text{Ag}_2\text{S}$ , and potentiometric determination of the excess of  $\text{AgNO}_3$  with thiourea or allylthiourea soln., an  $\text{Ag}_2\text{S}$  electrode being used. The method is applied to a study of the kinetics of sulphur cleavage in the hydrolytic decomposition of gelatin.

SVEJSTKA, L.

✓How to determine the degree of washing in photographic emulsions. L. Svejstka. *Chem. Frimyrd* 5, 239-43 (1955).

—The effect of type and concn. of photographic gelatin on the potential of Ag electrodes in the soln. of AgBr emulsion at various temps., Ag-ion concns., and pH values was studied. These factors influence the pBr value. The solubilities of AgCl, AgBr, and AgI at higher temps. were measured by a concn. cell with the test soln. on one side and 0.01N AgNO<sub>3</sub> on the other side. As a result of this study, the following procedure to test the Ag potential in the emulsion is suggested:

The sample of emulsion noodles is dissolved on a water bath at 40° in semidarkness. A Ag electrode, a KNO<sub>3</sub> salt bridge connected at the other end with an unsatd. HgCl-electrode, elec. stirrer, and a thermometer are immersed in the soln. One to 2 min. after the temp. of the emulsion has reached 40° the electrode attains a const. potential which is a measure for the degree of washing. This potential is then converted to the pBr value by means of a chart.

PURPOSE: This book is intended for the general reader interested in astronomy, celestial mechanics, and astrophysics.

COVERAGE: The book presents in popular language and in summary form the most important achievements of science to date in the field of astronomy, celestial mechanics, and astrophysics, and notes the importance of continued progress in these disciplines, and for space travel to the moon and in our solar system, and ultimately to the nearest stars and galaxies. In the section headed "About the Authors" the degrees and titles, and scientific contributions of each author are given. The text is accompanied by many diagrams, graphs, and tabular data. There are 37 photographs of various celestial bodies. No personalities

Card 37-62-

are mentioned. There are 29 references, all Czech [several translations].

TITLE: Spectrum of the chromospheric flare of July 20, 1958

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 4, 1962, 54 - 55,  
abstract 4A435 ("Byul. astron. in-tov Chekhoslovakii", 1961, v. 12,  
no. 3, 73 - 81, English; Russian summary)TEXT: Analysis of hydrogen lines of Balmer series H $\alpha$ -H $\epsilon$  in the spectrum of  
the flare of July 20, 1958, has shown that  $\ln(I-I_0)$  is not a linear function of  
 $\ln\Delta\lambda$ , where I is intensity of the line at a distance  $\Delta\lambda$  from the line center in  
the spectrum, and  $I_0$  is intensity of undisturbed line at the same spot. Devia-  
tions from linearity in far wings of the line, where intensity of emission is  
small, can be partially explained by disturbances in the Earth's atmosphere and  
tremors of the image due to this fact. For the central parts of the profiles,  
the above-mentioned deviation could be explained by an increase of the optical  
thickness  $\tau$ , because at  $\tau > 1$  linearity of the indicated relation is violated.  
In this case, such values should be found for electron density  $n_e$  and the number

Card 1/4

of hydrogen atoms in the second quantum state  $n_2$ , that  $\ln\tau$  would be a linear function of  $\ln\Delta\lambda$  for all the lines. At the constant value of function of source E throughout the flare region this condition is not fulfilled. If an assumption is made that E grows with altitude, the resulting  $\tau$  turns out to be too great, but if E decreases with altitude neither the profile shape of Balmer lines nor metal line emission can be explained. The author arrives at a conclusion that the broadening of lines observed during this flare cannot be explained either by Stark effect or by attenuation. If the line broadening is explained by the Doppler effect, the quantity  $\ln(I-I_0)$  should be a linear function of  $(\Delta\lambda)^n$  where  $n = 2$ . The author concludes that Balmer line profiles can be explained by Doppler broadening if  $n < 2$ . Such a deviation of the exponent value could be explained by non-Maxwellian velocity distribution of turbulent motions of macroscopic or microscopic elements in the flare region. However, since Ca and He lines are broadened considerably less than hydrogen lines, this explanation is untenable. The author is of the opinion that observational results can be explained by the existence of an altitude gradient of characteristic velocity of turbulent motion, which leads to decreasing n for Balmer lines and to different Doppler half-width  $\Delta\lambda_D$  for Ca and He lines, if they are generated in other

AUTHORS: Švestka, Z., Kopecký, M., Blaha, M.

TITLE: Qualitative analysis of 244 spectra of chromospheric flares

PERIODICAL: Referativnyj zhurnal, Astronomiya, no. 1, 1963, 62,  
abstract 1.51.415 ("Byul. astron. in-tov Čehoslovakii",  
v. 12, no. 6, 229 - 237, English; Russian summary)

TEXT: The authors present the list of emission lines observed in spectra  
of 92 flares photographed in Ondřejovova from 1958 to 1960. The Ondřejovova spec-  
trograph can photograph the spectrum in several selected spectral regions  $\lambda\lambda$  6503 -  
- 6623, 5829 - 5949, 4797 - 4925, 4277 - 4397, 3870 - 3990, 3735 - 3817 and 3640 -  
3716. 244 spectra of these flares are qualitatively analysed, in particular spec-  
tral characteristics of hydrogen and calcium lines: the dependence of excitation  
change of the Balmer series on the central intensity and width of the H $\alpha$  line;  
the "center - edge" variation in excitation of the Balmer series and line widths  
of H $\alpha$  and H + K; the relation between the widths of lines H $\alpha$  and H + K; the  
central reversal of hydrogen and calcium lines; the change in spectral character-  
istic in dependence on the position of the flare region in the group of sunspots.

alloy, CV 49 magnetic alloy

ABSTRACT: The article gives information about the results of long-term measurements  
to ascertain the magnetostrictive characteristics of the Czechoslovak magnetic soft  
alloys PY 36, PY 50 and CV 49. By systematic measurement of samples from current  
production the mean value of saturated magnetostriction was established and their  
dynamic characteristics were verified on magnetostrictive transducers with 30 cps.

TITLE: Effect of prestressing on the load-carrying capacity of flexible compressed bars

SOURCE: Beton i zhelezobeton, no. 3, 1966, 30-34

TOPIC TAGS: reinforced concrete, mechanical property, bending strength

ABSTRACT: The article describes an experimental investigation which was conducted at the former TsNIPS [Tsentral'nyy nauchnoissledovatel'skiy institut promyshlennyykh sooruzheniy; Central Scientific Research Institute of Industrial Installations] and subsequently at the NIIZhB [Nauchno-issledovatel'skiy institut zhelezobetonykh izdeliy, stroitel'nykh i nerudnykh materialov; Scientific Research Institute of Reinforced-concrete Products, Construction and Non-Metallic Mineral Materials] of the State Committee for Construction Affairs USSR, into the effect of prestressing of longitudinal reinforcement on the operation of centrally compressed flexible bars. The investigation was carried out on pre-stressed short (rigid) and long (flexible) columns of equal rectangular section. The testing of the short columns was intended to ascertain the effect of the strengthening of concrete that hardens under compression, and the influence of this strengthening on the load-carrying capacity of flexible prestressed columns. Stability in

Card 1/2

0350

L 37790-66

ACC NR: AP6028834

axial compression resulting from the prestressing of longitudinal reinforcement was investigated on specimens of flexible columns manufactured under the same conditions as the short columns. Early precompressing of the concrete of short columns with stressed wire reinforcement was found to increase the mechanical properties of the concrete to some extent. However, the absolute value of this increase is not great, and the strengthening of the concrete may not have any significant effect on the operation of flexible elements. There is a loss in the carrying capacity of prestressed and ordinary reinforced-concrete flexible elements with the given flexibility  $\frac{l_0}{h} = 40$ ; this is caused by the loss of stability in the

swollen state rather than by the exhaustion of strength in the concrete and reinforcement. Prestressing of longitudinal reinforcement increases the stability of flexible reinforced-concrete columns subjected to a longitudinal axial force. Orig. art. has: 7 figures, 4 formulas and 3 tables. ORG: Astronomical Institute of the Czechoslovak Academy of Sciences, Observatory  
OndrejovTITLE: Determination of electron density in flares<sup>17</sup>SOURCE: Ceskoslovenska akademie ved. Astronomicky ustav. Publikace, no. 51, 1965.  
3rd Consultation on Solar Physics and Hydromagnetics, Tatranska Lomnica, 13-16  
October 1964, 91TOPIC TAGS: solar flare, electron density, solar limb, Balmer series, electron  
temperatureABSTRACT: The author states that the line profiles of Balmer emission lines expanded  
by the Stark effect can be well approximated by a Voigtfunction. The half-widths of  
these Voigt profiles are a good measure of the free-electron density in the radiating  
gas. In solar flares, where the electron density is high, electron damping must be  
taken into account, as has been done for several flares observed in Japan and  
Czechoslovakia by using the H<sub>10</sub>—H<sub>15</sub> lines of the Balmer series. In the flash state

Card 1/2

L 43785-66

ACC NR: AT6020502

of a  $3^+$  flare, the electron density has been found to be as high as  $4 \cdot 10^{13} \text{ cm}^{-3}$ , with the electron temperature assumed to be 10,000 k in all flares. The density decreased by 50% during the 15 min of flare development. Even in small flares the electron density still remains close to  $10^{13}$ . The electron density is lower only in the upper parts of the flares on the solar limb. [GC]

TITLE: Filamentary structure of flares

SOURCE: Ceskoslovenska akademie ved. Astronomicky ustav. Publikace, no. 51, 1965.  
3rd Consultation on Solar Physics and Hydromagnetics, Tatranska Lomnica, 13-16  
October 1964, 95-97

TOPIC TAGS: solar flare, electron density, electron temperature, Doppler effect,  
Stark effect, Balmer series, hydrogen spectrum, flare filament

ABSTRACT: On the basis of previous works, the author states that some methods hitherto  
used to analyze the flare spectra are, from the standpoint of filament structure,  
incorrect in principle. There are other methods to obtain information on the real  
physical conditions in flares, even if filament structure is taken into account. For  
instance, some methods use only relative forms of the line profiles, some methods  
compare relative intensities in various lines produced under similar physical conditions.

Card 1/2

L 46817-66

ACC NR: AT6020504

and some methods are restricted to the optically thin flare lines, which only reflect the emission of the flare filaments. The  $n_e$  values obtained with the methods of half-widths are very similar to the actual electron density in the flare elements. The  $N_2$  values are the minimum values of the quantity  $N_2$  in flares with a filament structure. Electron temperature is below 10,000 K in the filaments producing a hydrogen spectrum. The electron temperature and electron density in the flare elements emitting neutral helium lines are higher than in the elements emitting a hydrogen spectrum. The Doppler effect and the Stark effect influence the different lines in different ways. The Stark widening of the high terms of the Balmer series was observed clearly. The minimum half-width has been found for  $H_9 - H_{10}$ ; the half-widths increase for all higher lines. The author believes that present knowledge of the fine structure of flares is not sufficient to permit a detailed discussion of its origin.

TITLE: The negative hydrogen ion emission in flares ✓

SOURCE: Ceskoslovenska akademie ved. Byulleten' astronomiceskikh institutov Chekhoslovakii, v. 17, no. 3, 1966, 137-140

TOPIC TAGS: solar flare, flare continua, hydrogen ion emission, radiation temperature

ABSTRACT: In a search for an explanation for the continuous emission of flares in the optical region, it was of interest to show that the emission of negative hydrogen ions simply cannot be rejected as one of the possible causes of the optical flare continua. Using known physical data on three solar flares, it is shown that this process could produce the observed continuous emission in such flares or flare elements in which the Lyman alpha radiation temperature is lower than  $\sim 7500K$ . If such flares or flare elements existed, they would probably be situated very low in the chromosphere. In such a case, heating of the upper photospheric layers beneath the flare or of some grains inside the photosphere might also participate in the formation of the flare continua. The wavelength variation of the relative intensity of the  $H^-$  continuous emission is in good agreement with that observed for flares situated in limb parts of the solar disc. TITLE: Temperature control of converter metal by means of zirconium boride cermet tips

SOURCE: Poroshkovaya metallurgiya, no. 5, 1964, 98-101

TOPIC TAGS: thermocouple, zirconium boride, converter process

ABSTRACT: Difficulties in replacing the insulated tips of a thermocouple during the production process were solved by using a clay plug and a supporting disk which close the opening of a converter and prevent the loss of metal regardless of the degree of erosion of the opening. Furthermore, the new device makes the use of oxygen possible to take apart the opening. The device has been successfully applied in the industrial production in a 50-ton converter. A thermocouple with a zirconium boride tip reflects all irregularities that may occur during the melting process such as changes in temperature, the amount of oxygen used, the location of the tuyeres, etc. As a result of continuous temperature control, the necessary information is obtained for the development of an

Demodulation of Amplitude-Limited Oscillations.—D.Y. Svet. [C. R. Acad. Sci. U.R.S.S., 21st July 1948, p. 441.] (Eng. transl., p. 441-443, in Russian.)  
Simple theoretical considerations show that demodulation can be achieved by using a detector with rectangular  $I \propto V_m$  characteristics. The amplitude-modulated amplitude-limited signal is converted by this detector into rectangular pulses whose width is determined by the rate of variation of the input-signal voltage. The amplitude modulation can then be detected by using a second detector having similar characteristics. See also 77 above.

Radiothermographic study of the Metzger process

18  
Svet, D.Ya., Novosibirsk, USSR, 1954  
In this paper we will discuss the method of heat treatment from the flame above the bottom of the furnace of the complete cycle of the desulfurization reaction. This method of treatment requires less time than the ordinary heat treatment, which is more than 10 times faster. In the case of the use of a steady-state flame, particularly the method of treatment is more reliable. The grains of the charge do not get radioactive during the process and the temperature of the charge is constant. The flame and temperature of the bath also do not change. It is due to the fact that the flame is not directly in contact with the charge. The method of treatment is more reliable than the ordinary heat treatment because it does not require a large amount of energy and it is more effective.

TITLE: Automatic Photoelectric Colorimetric Pyrometers (Ob avtomati-  
cheskikh tsvetovykh fotoelektronnykh pirometrakh)

PERIODICAL: V sb.: Issled. po zharoprochn. splavam. Vol 2. Moscow,  
AN SSSR, 1957, pp 290-294

ABSTRACT: A presentation of the principle of operation of an automated  
photoelectric colorimetric pyrometer employing the "red-blue"  
ratio method and serving for direct determination of the sur-  
face temperatures of bodies in the range of measurement and  
for the recording of color temperatures in the 1400-2500°C  
range (with possibilities for significant expansion at both ends  
of the scale), having a fundamental error of measurement  
 $\leq \pm 2.2^\circ$ . A block diagram of a modernized TsEP-2M pyro-  
meter is presented, along with a description of its various  
design assemblies and of the set as a whole and of the area of  
application in the metallurgical industry. 1. Photoelectric pyrometers

(Elektronnye sistemy radiatsionnoy pirometrii spektral'nogo  
otnosheniya)

PERIODICAL: V sb.: Issled. po zharoprochn. splavam. Vol 2. Moscow,  
AN SSSR, 1957, pp 295-310

ABSTRACT: A presentation is made of the fundamentals of radiation pyrometry, with especially detailed examination of color-sensitive photoelectric pyrometry. Schematic diagrams of color pyrometers, both of the single-channel direct-measurement and of the compensated types, are presented. Actual photoelectronic systems for various purposes are examined and the design of certain instruments are described, such as for oscilloscopic recording of rapid temperature processes. This instrument comes in two variants: one with a rotating light filter, and one with a fixed filter for high velocities. Instruments have been developed to measure the color temperatures of luminescent surfaces with high temperature inertia by

employing a photoelectric cell with a barrier layer. In these designs the function of measuring element may be performed by a direct-reading instrument, or else the reading may be from a scale connected with a reducing device. It is indicated that the method described may be used to permit regulation of high-temperature processes by means of standard compensation devices. A schematic diagram of the pick-up of a thermocolor regulator is presented, and a photograph of a mockup thereof.

TITLE: On the Possibilities of Solving the Fundamental Problem of Radiation Pyrometry in Metallurgy ( O vozmozhnostyakh resheniya osnovnoy problemy pirometrii izlucheniya v metalurgii )

PERIODICAL: V sb.: Issled. po zharoprochn. splavam. Vol 2. Moscow, AN SSSR, 1957, pp 311-317

ABSTRACT: The author believes that the major problem of radiation pyrometry is the objective measurement of the true temperature to the required degree of accuracy under conditions of radiation corresponding to the conditions of actual practice, and in essence the non-contact measurement employing radiation alone. It is shown that the methods of color pyrometry make measurement possible without the explicit determination of emissivity as such and that measurement with reference to the spectrum may be performed in the infrared (IR) and ultra-violet (UV) bands of the spectrum. For work in the IR band a design is suggested for an optical-acoustical pyrometer,

On the Possibilities (cont.)

characterized by monochromaticity and high sensitivity. The possibility of measuring temperature by radio-wavelength radiations from a body (millimeter and centimeter waves) is demonstrated. This is of interest for measurements in heat engineering, since media consisting of diatomic and triatomic gases contain areas of transparency, i.e., the distortion due to the intervening atmosphere of the metallurgical furnace is lacking.

TITLE: Some Aspects of Radiation Pyrometry of Liquid Metal (Nekotoryye voprosy radiatsionnoy pirometrii zhidkogo metalla)

PERIODICAL: V sb.: Fiz.-khim. osnovy proiz-va stali. Moscow, AN SSSR, 1957, pp 399-407. Diskus. pp 408-409

ABSTRACT: The method and apparatus proposed by the author permit to determine the radiating power of the surface of a liquid metal by the magnitude of the coefficient of reflection (CR) without interference from the flow of reflected radiation. The method of determination of the CR of a radiationally emissive surface is based on preliminary modulation of the flow of radiation incident on that surface. The device consists of a system of mirrors, a shutter, a temperature lamp, a turret with light filters, a photocell, an amplifier, and a recording device. The photocell is alternately subjected to a stream of modulated radiation from the temperature lamp and to the total flow of the independent radiation and the reflected flow of the modulated radiation. The amplifier, which is tuned to the modulation frequency,

Card 1/2

137-58-5-11025

Some Aspects of Radiation Pyrometry of Liquid Metal

generates an alternating voltage, the amplitude of which is proportional to the intensity of the radiation flow incident on or reflected from the surface of the bath. Knowing the CR of the mirrors and the ratio of two measured voltages, it is possible to determine the value of the CR of the metal surface which is related to the coefficient of radiation. A peculiar requirement of the method of measuring surface characteristics of a liquid metal is the employment of special shock absorbers in order to prevent "rippling" of the liquid free surface. The method of measuring the CR of molten metal in a bath is based on a comparison of CR values of the surface being investigated (cast iron and Ag) measured before and after an experiment. At high temperatures the error is determined by the accuracy of graduation.

Sovremennye problemy metallichestva [Modern Problems in Metallurgy]  
Moscow, Izd-vo Akad. Nauk, 1950. 640 p., 5,000 copies printed.

Lang, M.A.M. Samarin, Corresponding Member, USSR Academy of  
Sciences; Eds. of Publishing House, V.S. Krasavtsev, and  
A.M. Dorovits, Tech. Eds. T.V. Poljakova.

PURPOSE: This book is intended for scientific and technical personnel in the field of metallurgy.

CONTENTS: This is a collection of articles on certain aspects of Soviet metallurgy. The book is dedicated to Academician Ivan Pavlovich Bardin on the occasion of his 75th birthday. The book is divided into seven parts. The first part consists of ten articles presenting a brief account of the biography and professional activity of the author. The second part includes an article by John Chipman, Nicholas Oravit, and John Elliott (U.S.A.) describing their meeting with Bardin in Moscow and also his visit to the United States. The second part consists of three articles and deals with raw materials and fuels for the Soviet metallurgical industry. The third part represents the major portion of the book. It consists of 25 articles dealing with the various aspects of the metallurgy of pig iron and steel. The fourth part consists of two articles treating the metallurgy of nonferrous metals. The fifth part consists of three articles on the forming of metals. The sixth part consists of eight articles discussing certain aspects of physical metallurgy. The last part deals with general problems in the field of metallurgy. References are given after each article. No personalities are mentioned.

TEXT: Preliminary investigations showed the efficiency of using in infrared pyrometry germanium photodiodes, which are semiconductor devices having much in common with a valve photocell. The integrated sensitivity of germanium photodiodes exceeds that Se-photodiodes by a factor of 100; maximum sensitivity of germanium photodiodes is at the  $1.5 \mu$  wavelength. This device consists of a plate of Ge contact surfaces, which was pressed into polystyrene and was covered by a transparent organic glass window. Schott light filters (R-9, RG-7 and BG-18) are used for the monochromatization of infrared radiation perceived by the germanium photodiode. With these

filters germanium photodiodes were used in pyrometers of partial radiation and spectral-ratio pyrometers. The germanium photodiodes were tested in spectral-ratio pyrometers with direct measurement of photocurrents by a galvanometer and reduction of luminosity with the aid of a diaphragm. The replacement of Se-photodiodes by Ge-photodiodes makes it possible to reduce the range of measured temperatures down to 500 - 550°C and to reduce considerably the pyrometer dimensions. Monochromaticity and high sensitivity in the infrared range of the spectrum are characteristic of the model of an optic-acoustical spectral-ratio pyrometer, which was designed at IMET AS USSR. Its operational principle consists in the use of 2 optic-acoustical chambers as converters of radiant energy into electric one; the chambers are filled with gas and possess the zones of resonance absorption within the required spectrum range. The radiation flux is modulated by a rotating perforated disk. Changes in the gas pressure under the effect of intermittent radiation are converted with the aid of two microphones into a.c. voltages, whose amplitudes are proportional to the corresponding spectral luminosities. It is expedient to employ the microradiowave range for pyrometry. In principle, the radioradiation pyrometer is a very sensitive radio-receiving set.

1, pp. 41-44

TEXT: The author suggests to use a germanium photo-diode as radiation receiver of infrared radiation for temperature measurements of bodies. The integrated sensitivity of germanium photo-diodes exceeds that of ordinary selenium cells nearly by 100 times. The maximum spectral sensitivity falls at the  $1.5\mu$  wavelength, while its red boundary is near  $2.0\mu$ . The time constant of the diode is  $10\mu$ sec. For monochromatization of infrared radiation it is possible to use the R-9, Rg-7+Bg-8 light filter of Messrs. Schott. In combination with these light filters, germanium photo-diodes make it possible to measure temperature in the range of  $800-100^{\circ}\text{C}$ , at a wavelength of  $1.0$  and  $1.5\mu$  with the aid of

## On Some Systems of Radiation Pyrometry

brightness and color pyrometers. The temperature variations of photo-diodes substantially affect the results of measuring the magnitude of the spectral ratio. Germanium photo-diodes were tested in spectral ratio pyrometers with direct measurement of photocurrent by a galvanometer and variation of the luminous flux with the aid of a diaphragm. Semiconductor devices of the photo-diode system were tested in the  $\text{U}^3\text{P}$ -(TsEP-)-2M automatic photoelectronic color pyrometers. Great difficulties in the development of infrared pyrometers arise because of the complication of producing simple systems of radiation monochromatization. The IMET AN SSSR has worked out the model of a spectral-ratio optical-acoustical pyrometer for the infrared range of the spectrum. The width of spectral intervals in this model is determined by the bandwidth of the molecular spectrum. The principle of operation of the device consists in the following: Optical-acoustical chambers filled with gases which possess regions of resonance absorption in two different sectors of the infrared range of the spectrum are used as converters of modulated light pulses into electric ones. Gas pressure variations under the effect of modulated radiation are, with the aid of microphones located in the chambers, converted into an a-c voltage, the amplitude of which is proportional to the spectral brightness in the regions of resonance absorption of the gases. The electric pulses are amplified and transmitted to the electronic circuit of ratio measurement. For measurements in the medium infrared spectrum range the

chambers can be filled with chloroform or some special organic compounds. The author points out the prospects of using radiation pyrometry in the microradio-wave range. There are 8 references.

PURPOSE: This book is intended for metallurgists and metallurgical engineers.

CONTENTS: This collection of scientific papers is divided into six parts: 1) thermodynamic activity and kinetics of high-temperature processes; 2) constitution diagram studies; 3) physical properties of liquid metals and slags; 4) new analytical methods and production of pure metals; 5) pyrometry; and 6) general questions. For more specific coverage, see Table of Contents.

## V. PYROMETRY

Svet, D.YA. Modern Radiation Pyrometry	546
Rudnitskiy, A.A. Thermocouples for Measuring High Temperatures	563
Several types of thermocouples were investigated for their suitability for use at high temperatures (mostly in the 1700-2000°C range). The most satisfactory types were found to be those of platinum and rhodium alloys (for use in the 1300-1850°C range). An advantage of these thermocouples is the stability of their thermoelectric characteristics in an oxidizing atmosphere, an important atmosphere, and in vacuum. A reduction of pure metals, however, is harmful to this type of thermocouple.	
Svet, D.YA., and Ye. S. Lipin. TAKH-2K Automatic Photoelectric Optical Pyrometer	574
Spektor, Ye. Z. Temperature Measurement in Vacuum Melting	580
Samarin, A.M., and D.YA. Svet. Photoelectric Pyrometry of Liquid Metal	636
Investigations were made of the spectral radiating power of the surface of metal baths of various chemical compositions using various methods. Results were in agreement. The regularities established determined the connection between color temperature and actual temperature of clean and oxidized metal-bath surfaces. On the basis of a large number of investigations it was established that the value of the coefficient of transition from color temperature to actual temperature has practically no relationship to the presence of alloying elements and is unvarying in the presence of carbon between the limits of 0.01 and 3.5 percent. A comparison of various methods of radiation pyrometry showed that the optical spectral-ratio method is the most effective for continuous temperature control and thermography of liquid metal.
