6261. ANALYSIS OF A TRANSFORMERLESS LINE-SCANNING GENERATOR. L. Szántó.

Slabeproudý Obzor, Vol. 19, No. 6, 377-81 (1958). In Slovak.

The generator considered consists of a pentode, a diode, two inductance coils, two capacitors and a parasitic capacitance. One of the inductances is the deflection coil and this is connected across the diode. The cathode of the diode is connected to the anode of the pentode by means of the second coil which forms the primary of the e.h.t. transformer; this coil is terminated with capacitors at both ends. An equation for the current in the deflection coil is derived under the assumption that both coils are lossless. The equation is used to plot the current during the return trace and to determine the conditions for a non-oscillatory, linear forward trace. The analytical results can be used in the design of actual generators and are in good agreement with experimental data.

TITLE: Transient Characteristics and Cross-talk in Synchronous Detection of Quadrature-modulated Signals

PERIODICAL: Slaboproudý obzor, 1960, Vol. 21, No. 10, pp. 587 - 593

TEXT: The article gives a theoretical analysis of the relations obtaining in synchronous detection of quadrature-modulated signals, as is the case for the colour sub-carrier in colour television. The article assumes an ideal synchronous detector, i.e. one which satisfies the laws of superposition, whose response is proportional to the scalar product of the input-signal vector and the reference-signal vector. It is further assumed that the bandpass filter at the input to the detector and the low-pass filter at the output satisfy the frequency relations shown in Fig. 2 (a) - idealised amplitude and phase characteristic of the bandpass filter;

Card 1/4

Transient Characteristics

20895
Z/039/60/021/010/001/001
E140/E335

(b) - characteristic of the low-pass filter). A further assumption is that the picture-carrier has a low depth of modulation while the colour-carrier may have an arbitrary depth of modulation. The low-pass analogy to the system is shown in Fig. 3, where the two low-pass filters correspond to the lower and upper sidebands of the bandpass filter. The maximum cross-talk is found for arbitrary amplitude characteristics of the filters. A check of the relationships obtained is carried out by verifying the results presented by H. Schüpfelder (Ref. 3: Archiv der Elektrischen Übertragung, November, 1958, Vol. 12, 1958, No. 11, pp. 497-509). Calculations according to the following equation:

$$p = \frac{e_{Q \max}}{e_v} = \frac{K_{dQ}(o)}{K_d(o)} \frac{S_{\omega_1}}{\pi K(\Omega_r)} \quad (20)$$

yield 5.56% cross-talk, compared with the published result of 6%.

TITLE: Line scanning generators using silicon controlled rectifiers

SOURCE: Slaboproudny obzor, v. 26, no. 10, 1965, 588-595

TOPIC TAGS: electric generator, silicon controlled rectifier, electronic circuit

ABSTRACT: The conditions are determined for the optimal design of a generator using a silicon controlled rectifier. The minimal breaking capacity of the rectifier under the given conditions of line scanning is regarded as a criterion of optimal design. The derived formulas permit a rapid computation of a circuit that is in very close agreement with the experimental results. Orig. art. has: 13 figures and 52 formulas.

"Effect of Trypsin and Pancreatin Digestion on the Iodide-Containing Proteins and Amino Acids of the Thyroid."

Budapest, Kiserletes Orvostudomany, Vol XVIII, No 5, Oct 66, pages 502-506.

Abstract: [Authors' Hungarian summary] The effect of trypsin and pancreatin on the I^{131} -labelled thyroid-proteins of rats was studied. In an identical medium, completely different results were obtained. The splitting ability of pancreatin proved to be greater and this excess appeared in the thyroxine and triiodothyronine fractions. The eventual importance of the quantitative ratio of thyroid hormones which are bound in two different ways is discussed. 4 Hungarian, 12 Western references. [Manuscript received 23 Oct 65.]

286. ON SJÖGREN'S DISEASE - Szanto L., Farkas K. and Gyulai E.
2nd Dept. of Med. and Dept. of Patho-Anat., Nat. Inst. of Rheumatol. and
Balneol., Budapest. RHEUMATISM 1957, 13/3 (60-63) illus. 3

The authors suggest that Felty's syndrome, Still's disease, Reiter's syndrome and Sjögren's disease have a common rheumatic aetiology. The variation in clinical patterns is due to the different organs affected although in all instances the pathological manifestations are localized in all cases to the mesenchyma. Sjögren's disease is characterized by a decrease or absence of lacrimal and salivary secretion with dryness of ocular and oral mucosa. Chronic inflammation develops in the lacrimal and salivary glands as a result of functional deficiency. There may be dryness of the skin and gastrointestinal symptoms with atrophy of the mucosa which may be accompanied by hyperchromic anaemia. This disorder is found, most often in postmenopausal women, and if it occurs prior to the menopause there is usually detectable ovarian dysfunction. The onset of symptoms is usually preceded by articular disease and Sjögren found arthritis in 80% of his cases, affecting principally the larger joints. Two illustrative cases, one with autopsy findings is presented. On the basis of histological studies it is concluded that Sjögren's disease develops on the basis of rheumatic allergic mesenchymal lesions.

SOURCE: Kiserletes orvostudomany, v. 17, no. 6, 1965, 634-647

TOPIC TAGS: amino acid, tyrosine, hormone, iodine, isotope separation, chromatography

ABSTRACT: In the case of butanol extraction and chromatographic separation from KI¹³¹ or I¹³¹-labelled tyrosine, or compounds with a thyronine skeleton, the particular phase of the procedure at which a loss of iodine appears as well as the degree of this loss have been determined. The investigations were carried out in aqueous solutions and on materials mixed with serum for comparison. The problems and questions of composition of the thyroid hormones and precursors as well as of BII have been mentioned briefly. Finally, the reliability of the isotope method described and the problem of its usefulness have been discussed. The authors thank Laboratory Assistants Laszlo Cecilia and Doctor Baranyai Jozsefne for technical help. Orig. art. has: 4 figures and 3 tables. [JPRS: 34,161]

I sup 131

22

SOURCE: Kiserletes orvostudomany, v. 17, no. 6, 1965, 648-655

TOPIC TAGS: rat, iodine, blood serum, isotope, tracer study

ABSTRACT: In the course of the experiments, the analysis of the blood serum of
rats treated with labelling-amounts of I131 are described. It is concluded that
there is a great difference between the amount of iodine-hormone fractions and the
total amount of serum organic iodine. It is discussed in detail and it has also
been proven by means of a mathematical method that the results obtained with the
active method can not be considered as analogous to those obtained with the inactive
method. The results obtained with active methods correspond to the true conditions
only approximately, partly because of their biological half-life and partly because
of various degrees of iodine losses occurring in the course of the determination
and explained by the instability of the iodine derivatives. The authors thank
Laboratory Assistants Laszlo Cecilia and Doctor Baranyai Jozsefne for technical
help. Orig. art. has: 3 figures and 1 table. [JPRS: 34 161]

"Contribution to the Evaluation of the Indices of Thyroid Function"

Budapest, Kiserletes Orvostudomány, Vol 18, No 6, 1966; pp 654-662.

Abstract: Authors compare two different methods of evaluating the chromatograms of rat thyroid glands digested with pancreatin. After discussing their experimental and mathematical results, authors come to the conclusion that although the percentage distribution on the filter paper does contain data characteristic of the thyroid function, this distribution must be supplemented by the K constant, which may be calculated from the ratio of the weight of the animal and the weight of the thyroid gland. 14 References, of which 6 Hungarian, rest Western. Changes in the vitamin E content of the organs and tissues of young rats fed rations of different vitamin E content. Robert Turján, Magdalene Kramer, Magdalene Szántó, and Agnes Tóth (Inst. Nutrition Allied Sci., Budapest). *Intern. Z. Vitaminforsch.* 26, 220-5(1955).—For 10 weeks young female albino rats were fed rations contg., resp., 0.9, 4.6, and 9.5 mg. % tocopherol, then the vitamin E contents of serum, organs, and tissues were detd. In the serum and most organs and tissues the vitamin E content increased with increased intake; the content of the liver was approx. the same in all 3 groups. In female rats the supply of vitamin E is indicated by its content in the serum but not by its content in the liver. 16 references.

and culture methods

SOURCE: Academia scientiarum hungaricae. Acta microbiologica, v. 11, no. 3,
1964, 211-214

TOPIC TAGS: bacterial disease, immunology, bacteriology, fluorescence

ABSTRACT: Fecal samples from 200 typhoid carriers have been examined in order to
compare the immunofluorescent tracing with the conventional enrichment culture
technique. The presence of S. typhi was confirmed in 84 samples with culture and in
139 samples with immunofluorescent methods. Only 2 positive culture specimens
gave negative immunofluorescent results which, as a whole, increased the number
of positive results by 27.5 per cent. There was a 95 per cent agreement between
the positive immunofluorescent results obtained within one hour and the culture

The oxygen content of titanium-iodide rods. Stefan Koncz, Stefan Szanto, and Helene Waidhauser (Tech. Univ., Budapest). *Z. Naturwissenschaften* 41, 368-9 (1955).
 Ti rods made by the van Arkel process showed individual differences not explainable on the basis of metallic impurities. When several independent incandescent wires were set up in the same decompn. vessel and the deposition of Ti was continued on one of them and then switched over to the next one, it was found that although 70% crude Ti was left the rod 1st deposited was almost completely reevapd. regardless of the crude Ti supply. Only a porous skeleton of the 1st wire remained, 0.03% of its original wt. The 2nd wire built up at a fast rate, up to 0.015 mg. per sq. cm. per sec. Such a rod of double decompn. had lattice const. (α Ti) $a = 2.9500$, $c = 4.6728$ Å., the c value being lower than the best hitherto reported; this indicated high purity (Bumps, *et al.*, *C.A.* 47, 4180i), particularly lack of interstitial gases. The residue of the 1st rod showed, besides TiI₄, metallic Ti with an O content of 33 at. %, but no Ti-O compds. It is evident that in the van Arkel process a slight contamination with O can take place. B. I. C. van der Hoeven
