AUTHORS: Tanasiciuc, Claudiu, and Stănciulescu, Florin

TITLE: Contributions to the synthesis of binary sequential diagrams

PERIODICAL: Automatica și electronica, v. 6, no. 5, 1962, 197 - 203

TEXT: Starting with the description of sequential and combinational diagrams, and the application of the analogy between sequences and numbers, the authors first study the importance of the basic elements, i.e., intersection, memory and inhibition, which permit an ordination on the time axis, and by that a transfer from the sequential part to the combinational part of the selector-type diagrams. The authors then describe the method of synthesis by dynamic memories, and of synthesis by static memories. In case of the latter they distinguish the method with a-type connections, the method with b-type connections, the method with mixed connections and the method with connections in the combinational part. Two practical examples of the mixed method are then presented, the first provided with electromagnetic relays, the second with static transistor relays. The laboratorul de comutatie statica al Secției de Automatică și Telemecanică din cadrul

A065/A126

Institutul de Cercetări Electrotehnice (Laboratory of Static Switching of the Automation and Telemechanics Section within the Electrotechnical Research Institute) has developed several binary sequential selection diagrams based on the mentioned synthesis methods which supplied good results during laboratory tests. Conclusions: The methods exposed allow a synthesis of sequential diagrams without using the minute diagram of the classic theory given in Ref. 2 (D.A. Huffman: The synthesis of sequential switching circuits, J. Franklin Inst. 3/4, 1954). The methods exposed are valid for all electrodynamic and static switching elements. The authors finally present in two appendices the symbols of basic elements and a brief description of the "NOR" function. There are 9 figures and 1 table.

TITLE: Modification of the domain structure of barium-ferrite single crystals under the influence of a magnetic field

SOURCE: Physica status solidi, v. 6, no. 1, 1964, 141-150

TOPIC TAGS: domain structure, barium ferrite single crystal, Bitter pattern, barium ferrite, Bloch wall

ABSTRACT: With a view toward confirming a domain-structure scheme previously proposed by two of the authors for the basal plane (see Fig. 1 of the Enclosure), this paper presents some results of the investigation of Bitter-pattern modifications in barium-ferrite single crystals in an external magnetic field. Since in single crystals more than several μm thick, the domain patterns are much more complicated than in thin specimens, the authors limit themselves to qualitative considerations. The samples were prepared by the flame-fusion method and cut parallel to the cleavage planes perpendicular to the hexagonal axis; the specimens thus ob-

O

tained measured 5 to 10 mm in diameter and 2 to 4 mm thick. The property of the crystals to cleave along the basal plane made it possible to obtain nearly perfect surfaces not requiring mechanical polishing. Bitter patterns were observed with the "Zeiss-Neophot" microscope by using the Bitter colloid technique. It was found that the characteristic Bitter-pattern change in an external magnetic field is the same for all four domain-structure types mentioned in the previous work. In general, boundary displacement was smaller where the distances between neighboring Bloch walls was smaller; small undulations in the walls vanished as field strength was increased. It is shown that the "apparent saturation" on the lateral plane is attained at much lower field values than for the basal plane. It is concluded that all four types of domain structure observed are of the Kittel-Goodenough type, that is, the basic domain structure consists of 180° domains magnetized in the two easy directions without closure domains at the hexagonal planes. The shape of the domain walls, generally undulating, may be more or less regular; for large crystals, reverse spike domains can also occur in the demagnetized state. By planimetry of the areas of opposite polarity, it is possible to estimate the magnetization value of the samples for various applied field values. Such a method is suitable for the investigation of the relationship between the domain and the degree of magnetization of the crystals. Addi-

tional information concerning the magnetization process can be obtained by extending the investigation to higher fields, especially near saturation. In this way it would be possible to observe more important changes of both the shape and size of domains owing to irreversible processes which also occur at lower field values but are less visible. Title : Squirrel cage induction motors with screened end rings

Periodical : Energ. byul., #10, 15-17, O 1954

Abstract : A method of improvement of starting torque in the induction motor suitable for continuous and interrupted running is discussed. This improvement to Stern's double ring system and the combination of Iosifov's system with starting rods and Shturman's open circuit in squirrel cage was satisfactory tested. Four drawings, 1 table and 5 Russian references (1951-1952).
