TITLE: Machines for pressure casting

PERIODICAL: <sup>26</sup> Standartizatsiya, no. 8, 1962, 46

TEXT: Two new standards are to be introduced on January 1, 1963: (1) ГОСТ 8532 - 62 (GOST 8532 - 62) (Machines for pressure casting with horizontal cold pressing chamber. Basic parameters and dimensions), which replaces ГОСТ 8532 - 57 (GOST 8532 - 57), and (2) ГОСТ 9978 - 62 (GOST 9978 - 62) (Machines for pressure casting with hot pressing chamber. Basic parameters and dimensions). The new standards include additional basic parameters, and some existing parameters are modified to take into account the latest developments in this field. Both standards have a number of basic parameters unified to obtain interchangeability of certain parts and sub-assemblies between machines.

Purpose: This book is intended for scientists and researchers in  
the field of spectroscopy, as well as for technical personnel  
using spectrum analysis in various industries.

Contents: This volume contains 177 scientific and technical studies  
of atomic spectroscopy presented at the 10th All-Union Conference  
on Spectroscopy in 1956. The studies were carried out by  
members of scientific and technical institutes and include  
extensive bibliographies of Soviet and other sources. The  
articles cover many phases of spectroscopy: spectra of rare  
electromagnetic radiation, photochemical methods for controlling  
uranium production, physics and technology of gas discharge,  
optics and spectroscopy, abnormal dispersion in metal vapors, or  
spectroscopy and the combination theory, quantitative spectrum  
and mineralogical methods for quantitative determination of the  
and analysis of metals and alloys, spectral determination of the  
hydrogen content of steel by means of isotopes, and  
analysis of spectral lines, spark spectrography of calibration  
of statistical study of variation in the parameters of analysis in  
various determinations of traces of metals, spectrum analysis in  
metallurgy, thermochromatography in metallurgy, and principles and  
practices of spectrochemical analysis.

TITLE: An oscillator based on switching diodes for generating three-cycle current pulses for magnetic logic elements

SOURCE: Avtomatika i priborostroyeniye, no. 4, 1965, 66-68

TOPIC TAGS: logic element, magnetic core storage, pulse oscillator, junction diode

ABSTRACT: A three-cycle pulse generator based on diodes has been developed by the Institute of Foundry Problems AN UkrSSR (Institut problem lit'ya). The generator (Fig. 1) is a ring-type three-place 1/2-wave shift register. The elements in the register are three-winding transformers Tr<sub>1</sub>-Tr<sub>3</sub> (ferrite cores with rectangular hysteresis loop) and switching diodes D<sub>5</sub>-D<sub>10</sub> connected in series with junction diodes D<sub>2</sub>-D<sub>4</sub>. The cadence pulse source for the register is an RC relaxation oscillator. The load is connected in the cathode circuit of the switching diodes. In the initial state, diodes D<sub>5</sub>-D<sub>10</sub> are closed and capacitors C<sub>2</sub>-C<sub>4</sub> are charged nearly to the voltage of the power supply. The oscillator is triggered by prerecording a "1" in two elements of the shift register, e.g. Tr<sub>1</sub> and Tr<sub>2</sub>. With the first cycle of the master oscillator, both "1's" are transcribed and pulses are shaped in the W<sub>1</sub> windings of these transformers which open switching diodes D<sub>5</sub>, D<sub>6</sub>, D<sub>7</sub> and D<sub>8</sub> simultaneously.

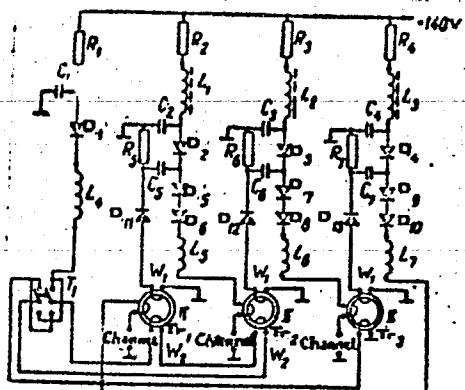

Fig. 1. Principle diagram of the generator.

ously through transfer circuits  $D_{11}-C_5-R_5$  and  $D_{12}C_6R_6$ . The discharge current from capacitors  $C_2$  and  $C_3$  generates a corresponding current pulse in the load: in circuit  $D_5$ ,  $D_6$ —a blocking pulse from channel I recording a "1" in  $Tr_2$ ; in circuit  $D_7$ ,  $D_8$ —an advancing pulse from channel II recording a "1" in  $Tr_3$ . Upon completion of the capacitor discharge, diodes  $D_5$ - $D_8$  are opened and the capacitors are charged through charging resistors  $R_2$  and  $R_3$  and coils  $L_1$  and  $L_2$  connected in series with these resistors. On the next cycle of the master oscillator, diodes  $D_7$ ,  $D_8$  and  $D_9$ ,  $D_{10}$  are opened, shaping a blocking pulse in channel II and an advancing pulse in channel III, respectively. These pulses record a "1" in  $Tr_3$  and  $Tr_1$ . With the third cycle of the master oscillator, the diodes for channels I and III are opened, generating

Card 2/3

12777-00  
ACC NR: AP6001522

a blocking pulse in channel III and an advancing pulse in channel I, and a "1" is recorded in  $Tr_1$  and  $Tr_2$ . Recording and readout are automatic. The original "1" is recorded on the cores of transformers  $Tr_1$  and  $Tr_2$  by reversing the direction of current in the  $W_2$  windings of these transformers through switch  $T_1$ . The switching diodes used in the device give advancing pulses with a current amplitude of 6 a with a load of up to 500 magnetic logic elements at a prf of 1-1.5 kc. The pulse duration is  $6\frac{1}{4}$  sec with a leading edge slope of  $2.5 \text{ a/sec}$ . Orig. art. has: 4 figures.

224. THE PROPHYLAXIS OF INDUSTRIAL LESIONS OF THE EYES IN CHEMICAL  
INDUSTRY (Russian text). Tartakovskaya A. VESTN.OFTAL. 1957, 2  
(47-53) Tables 2

During the years 1950-1956, a study was made on 1,050 workers in chemical industry, who were in contact with ammobenzol, toluene, sulphur gases, various acids and alkali used in dye stuffs. The examination showed that the majority of the workers suffered from chronic conjunctivitis and disease of the cornea, which was more marked with the age and duration of the work. The anaesthesia of the cornea re-

mained permanent. This could be explained as a reflex reaction in response to the constant irritating chemicals in the form of industrial poison. In 25 workers who worked with 'Thiuram' - an accelerator in the process of vulcanization of rubber - a decrease of light sensitivity, a concentric narrowing of the field to red colour and xanthopia were observed. In one factory, a paste named 'blue Dlasol O' used for dyeing cotton materials, produced a severe chemical burn of the eyes, since muratic acid formed upon entering the eye. Corrective goggles given to these workers, eliminated the burns of the eye by this paste. Another factory produced diphenyl-guanidine in powder form. The powder caused a severe irritation of the conjunctiva and cornea accompanied by pain, blepharospasm, photophobia and epiphora, sometimes a chemosis. The slit lamp showed punctate defects of the corneal epithelium. The wearing of goggles was of no use as the powder covered the glasses. Those workers who were sensitive to this chemical had to be transferred to another type of work. The majority of the workers (70%) with eye trauma were machinists and locksmiths. The author makes a plea for better automatization of manufacturing processes and hermetization of the equipment. Sitchevska - New York, N.Y.

TITLE: Reversibility of the Lyotropic Series of Alkali Metals

PERIODICAL: Zhurnal neorganicheskoy khimii, 1960, Vol. 5, No. 7,  
pp. 1612-1617

TEXT: The authors attempted to ascertain whether the reversibility of the lyotropic series  $Cs^+ > Rb^+ > K^+ > Na^+ > Li^+$  on phosphoric acid cation exchangers, claimed in publications (Refs. 4-6), was really possible. This phenomenon would be important for the industrial cleaning of rubidium salts from potassium impurities. The authors carried out their tests with a phosphoric acid cation exchanger of the type  $P_2O_5(RF)$ , which was pre-treated in compliance with ГОСТ 5695-53 (GOST 5695-53). Mixtures consisting of equal volumes of  $KCl$  and  $RbCl$  solutions were introduced into a column filled with RF in H form, and after 24 hours the column was washed out by means of 0.1  $HCl$  at a rate of 0.4 ml/min. K and Rb were determined in the eluate by a flame photometer consisting of atomizer, YM-2 (UM-2) monochromator, Б9И (ВЕI) photomultiplier, and mirror galvanometer. A

B004/B060

reversal of the lyotropic series was not observed. Potassium was eluted earlier than rubidium. Separation is rendered difficult due to the small distance between the two fronts. At a ratio of KCl : RbCl = 1 : 9, a drop in the sorption isotherm was only observed at the rear front of K. Similarly, no reversal was established in methanol solution or at increased temperature. The authors found in the course of their experiments that on conversion of the cation exchanger into Rb form not all hydrogen ions are replaced by rubidium, although there was the same rubidium concentration both at the inlet and outlet of the column. They explain this by ion exchange between the functional groups of surface and interior of exchanger grains. The RF cation exchanger contained acid groups with different degrees of dissociation. There are 6 figures, 2 tables, and 9 references; 5 Soviet and 4 US.

TITLE: Polyisocyanates suitable for protective coatings with superior photoresist-  
ance

SOURCE: Lakokrasochnye materialy i ikh primeneniye, no. 2, 1964, 3-6

TOPIC TAGS: lacquer, polyisocyanate, allylurethane, isocyanate polymerization,  
isocyanate telomerization, polyisocyanate nitrocellulose lacquer, photoresistant  
polyisocyanate lacquer, PAU polyisocyanate enamel

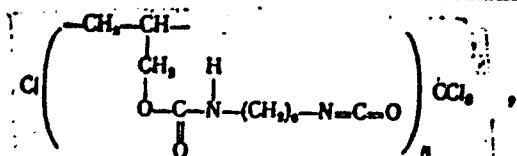

ABSTRACT: The present study deals with the polymerization of hexane-1-isocyanate-  
6-allylurethane (HICAU),  $\text{OCN}(\text{CH}_2)_6\text{NHCOOCH}_2-\text{CH}=\text{CH}_2$ .

The polymerization was conducted without solvents, in inert solvents, and in a  
carbon tetrachloride medium. Benzoyl peroxide (0.2-3.0%), di-ter.butyl peroxide,  
or dinitril-2,2'-azo-bis-isobutyric acid (DABIBA) were used as initiators. The  
reaction was allowed to run for 6 to 20 hours at 80 and 120°C before the viscosity  
and isocyanate numbers of the obtained poly-HICAU were determined. It was found  
that, in an inert solvent medium (toluene) and without solvent, the transformation

Card 1/3

ACCESSION NR: AP4034710

of the monomer did not exceed 45-50%, irrespective of the amount of initiator present. Extension of the polymerization time caused the formation of a precipitate of high-molecular compounds, which was soluble only in the original monomer. When the polymerization of HICAU was conducted in carbon tetrachloride (in a 1:1 ratio at 70-75°C for periods to 21 hrs in the presence of 1% DABIBA) there occurred a more rapid and complete polymerization of the monomer with the formation of low-molecular products. To these the authors ascribe the formula

where n is 5 or 6. The obtained polymer had a molecular weight of 1050-1070 and contained 13-14% of chlorine. Samples of such poly-HICAU of 1500 molecular weight were assigned the trade name PAU, and their solutions in various solvents were subjected to extensive lacquer and enamel coating tests, either by themselves or mixed with titanium dioxide, with nitrocellulose and alkyd and with phenolic resins. Films of high strength and good adhesion were obtained. They were superior in

TITLE: Single component cold-setting polyurethane varnishes

SOURCE: Lakokrasochnye materialy i ikh primeneniye, no. 1, 1966, 1-1

TOPIC TAGS: polyurethane, isocyanate resin, polyester plastic, varnish, paint

ABSTRACT: Several polyester-type prepolymers were synthesized from 2,4-tolylenedi-isocyanate and esterified glycerides of the castor oil and from 2,4-tolylenediisocyanate and polyesters prepared by condensation of propylene oxide with glycerine, trimethylolpropane, and ethylenediamine and were cold-set in humid air for 0-60 days. The properties of the starting materials and products are tabulated and graphed. It was found that all the synthesized single component prepolymers undergo cold-setting in humid air. It was also found that the setting of these prepolymers is catalyzed by triethanolamine. The hardened films exhibited excellent mechanical properties (hardness) and are recommended for use as varnishes. Orig. art. has: 4 figures, 2 tables, 5 formulas.

TITLE: Use of electromechanical feedback for damping the vibrations and radiations of plates

SOURCE: Akusticheskiy zhurnal, v. 12, no. 3, 1966, 382-384

TOPIC TAGS: vibration damping, flexural vibration, phase shifter

ABSTRACT: Results are presented of the application of a two-channel compensating system for attenuating the resonant flexural oscillations of plates and of the associated noise. In the proposed system, the signal from the vibration sensor is filtered, amplified at one of the resonant frequencies, and fed through a phase shifter to two vibrators. In exactly the same way, oscillations at another resonant frequency are filtered by another filter and are fed through the same vibrators and through another phase shifter. By controlling the phase and gain, it is possible to achieve a decrease in the amplitude of flexural oscillations of a plate at two resonant frequencies simultaneously. By increasing the number of channels, it is possible to increase the number of simultaneously compensated resonances. The test results show that the average level of sound pressure in the space close to the plate, at resonant frequencies, is

Antiaggregation effect in the coagulation of hydrophobic colloids by electrolytes. Yu. M. Glazman and B. R. J. Turtakovskaya. *Kolloid. Zher.* 11, 399-407 (1949). — A  $\text{AgI}$  soln (0.01 N + 5% excess of  $\text{Kl}$ ) was dialysed in cellulose bags until its elec. cond.  $\epsilon$  was  $8 \times 10^{-4}$ , and then electrodialysed between cellulose membranes until  $\epsilon$  was  $4 \times 10^{-3} \text{ ohm}^{-1} \text{ cm.}^{-1}$ . To 1 ml. of this sol. no much coagulating electrolyte (I) was at once added (its final concn. was  $c_1$ ) so that the turbidity of the filtrate after 24 hrs. of coagulation was 1.6 that of  $\text{MgO}$ , or I was added 1 drop daily until the filtrate taken 24 hrs. after the last drop had the 1.6 turbidity. In the 2nd case the final concn.  $c_1$  was less than  $c_2$ . From the earlier theory (*Kolloid. Zher.*, 9, 241 (1947))  $(c_2 - c_1)/c_1 = (1/k\alpha) \ln(1 + e^{-k\alpha} - e^{-k\alpha})$ , if  $1/\alpha$  is no. of drops used in the 2nd case and  $k$  is the const. of coagulation, ded. from the exptl. relation between the concn. of I and the time  $t$  after which the filtrate had the 1.6 turbidity. For  $\text{KCl}$ ,  $\text{BaCl}_2$ , and  $\text{CaCl}_2$ ,  $k$  was 0.076, 8.12, and 180 l./millimol., and  $k\alpha$  / was 6.2-6.5 for all 3 electrolytes. As  $k\alpha$  was independent of the nature of I,  $(c_2 - c_1)/c_1$  also was identical (-0.28 to -0.30) for these salts, and the above equation was confirmed ( $1/\alpha$  was 43-46). This proves that the rate of coagulation generally is an exponential function of the concn. of I, although expt. showed that very small amounts of I were less active than expected. In undialysed  $\text{AgI}$  soln greater initial amts. of I were inactive, wherefore the above equation yielded greater values of  $(c_2 - c_1)/c_1$  than found by expt. J. J. Bikerman

Title : Mechanism of adsorption of acids by active carbon from anhydrous solutions

Periodical : Dok. AN SSSR 98/1, 107-110, Sep 1, 1954

Abstract : The adsorption of a typically strong HCl acid by active carbon from different anhydrous solutions and from pure organic solvents was investigated in air and hydrogen atmospheres. The adsorption characteristics of the carbons, in the diluted solutions of strong HCl, NaOH, and KJ electrolytes, were found to be in perfect agreement with the electro-chemical theory of adsorption. The method of carrying out the adsorption experiments is described. Data, regarding the adsorption of HCl with O<sub>2</sub> and H-carbons, are presented in table. Twenty-three references: 19-USSR; 2-USA and 2-German (1920-1950). Table; graphs.

SOV/76-4-11-42/50

TITLE: The Reduction of Titanium Dioxide in the Presence of Titanium

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 11,  
pp 2635-2637 (USSR)

ABSTRACT: The reduction of  $TiO_2$  has so far always been carried out by means of direct contact of the reagent with  $TiO_2$ . In the present paper, the authors report on the reduction of  $TiO_2$  by means of Ti without contact between the two substances. Ti, in a quartz container, was submerged into the quartz test glass filled with  $TiO_2$  so that the reduction could only take place by way of the gaseous phase. The behavior of the  $TiO_2$ -modifications rutile and anatase was investigated at temperatures up to  $1100^\circ$  (Tables 1,2). The color changes observed at rising temperature are caused by  $Ti^{3+}$ -ions. After heating for five hours, the rutile had the composition  $TiO_{1.93}$ . Traces of  $Ti_3O_5$  appeared at  $1050^\circ$ .

Card 1/2

80V/78-4-11-42/50

The Reduction of Titanium Dioxide in the  
Presence of Titanium

The anatase was transformed into rutile. The reduction of  $TiO_2$  in the presence of Ti takes place within a wide temperature range. By corresponding variation in temperature and reaction time, dioxides with any deviation from the stoichiometric ratio can be obtained. Here, the  $TiO_2$  becomes a semiconductor. The authors thank D. N. Nasledov for the attention paid to the paper. There are 2 tables and 5 references.

TITLE:

Preparation of a Titanium Dioxide Semiconductor on Titanium at Low Oxygen Pressures

PERIODICAL: Zhurnal fizicheskoy khimii, 1960, Vol. 34, No. 4, pp. 809 - 814

TEXT: The oxidation of titanium in a gaseous phase obtained by heating powdered titanium oxide was investigated. In this way a gaseous phase containing only small amounts of oxygen was obtained. Titanium foils (0.6 mm thick, 20 X 20 mm<sup>2</sup>) with at most 0.08% C, 0.08% N<sub>2</sub>, 0.5% Fe + Ni, and traces of Cu were oxidized. The titanium oxide powder was annealed at 800° for three hours prior to use. In the first series of experiments anatase powder was used, in the second, rutile powder. Working temperatures ranged from 700° to 1100°, the weight increase in the titanium foil undergoing oxidation was determined by weighing. In the first series of experiments the color of the oxide film was observed to change with temperature, i.e., at 650-800° the oxide is light gray, but changes into dark gray and, at temperatures above 850°, into dark blue. An X-ray analysis showed that at ✓

Card 1/2

temperatures up to 850-900° an oxide film with a rutile structure forms. At 1100° two oxide layers were found, namely a thin upper layer of  $Ti_{3}O_5$  and a lower layer the X-ray picture of which was different, although its composition is likewise  $Ti_{3}O_5$ . The dependence of the growth of the oxide layer upon time was found to be parabolic, while the temperature dependence is governed by an exponential law. The results of the second series of experiments (Table) show that the sample weight increases at 700-900° only. The oxidation of titanium takes place while the titanium dioxide powder is greatly reduced. The oxide film forming during the process has an electrical conductivity of the electronic type. This electrical conductivity depends on the temperature at which the oxide film is produced. G. P. Lüchkin and G. G. Il'in are mentioned in the text. There are 5 figures, 1 table, and 19 references, 4 of which are Soviet.

TITLE: A study of the influence of oxygen generated during the reduction of  $TiO_2$  on the oxidation of titanium

SOURCE: Fizika metallov i metallovedeniye, v. 17, no. 4, 1964, 536-540

TOPIC TAGS: titanium oxide, titanium, annealing, sodium fluoride, hydrochloric acid, oxide formation, rutile titanium

ABSTRACT: The effects of oxygen (produced by reduction of  $TiO_2$  powder) on the physical properties of the oxide layer and on the rate of its growth were studied. It was established that it is possible to change the electrophysical properties of the  $TiO_{2-x}$  layer by immersing titanium in the oxide powder. Circular plates of Ti, 10 mm in diameter and 1.2 mm thick and with less than 0.1% impurities, were used for the oxidation experiments. Before oxidation, the plates were annealed at 1000°C for 1 hour, degreased, and then pickled in an aqueous solution of 5% NaF with 12% HCl. These plates were set vertically in porcelain debitenses and covered with  $TiO_2$  powder pre-annealed at 800°C for 3 hours. Oxidation occurred in a tubular furnace through which a constant current of steam was passed. Microphotographs of cut

Card 1/2

ACCESSION NR: AP4034052

sections were taken at 800C. Radiographic study of the structure of the material showed that the layer contained dioxide with rutile structure. As observed earlier by D. I. Layner and M. I. Tsy\*pin (FMM, 1960, 10, 543), the oxidation of titanium in air proceeded through molecular oxygen, whereas in steam it proceeded through atomic oxygen. The formation of atomic oxygen during the reduction of  $TiO_2$  explained the similarities in the physical properties of the layers formed in steam and in a steam-air mixture. The increase in the contribution of atomic oxygen in the oxide layer was responsible for the growth of this layer with significant deviation in the stoichiometric properties. Orig. art. has: 5 figures, 1 formula, and 1 table.

TITLE: Synthesis of dimethyl cyclosiloxanes containing functional groups in the ring

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye khimicheskikh nauk, no. 2, 1963, 294 - 298

TEXT: Dimethyl cyclosiloxanes with a functional group at the Si atom were synthesized by quantitative decomposition of dibasic sodium salts of  $\alpha,\omega$ -dioxy-methyl siloxanes with methyl trichlorosilane (I) or methyl-butoxy-dichlorosilane (II). The dimethyl cyclosiloxanes obtained differed in the numbers of Si and O atoms in their rings and were separated by fractionation. Reacting 1,5-disodium-oxy-hexamethyl trisiloxane with I yielded heptamethyl chloro-cyclotetrasiloxane (b.p. 85.5 - 86.5°C, yield 15%), pentamethyl-chloro-cyclotrisiloxane (b.p. 47 - 50°C,  $d_4^{20}$  1.0265,  $n_D^{20}$  1.4050, yield 2.6%), and nonamethyl-chloro-cyclopentasiloxane (III) (b.p. 129 - 132°C,  $d_4^{20}$  1.0410,  $n_D^{20}$  1.4083, yield 7.8%). Reacting it with II yielded heptamethyl-butoxy-cyclotetrasiloxane (b.p. 94 - 96°C, yield 13.9%).

pentamethyl-butoxy-cyclotrisiloxane (b.p. 67 - 71°C,  $d_4^{20}$  0.9653,  $n_D^{20}$  1.4044, yield 2.1%), nonamethyl-butoxy-cyclopentasiloxane (b.p. 134 - 137°C,  $d_4^{20}$  0.9797,  $n_D^{20}$  1.4110, yield 4.8%), and undecamethyl-butoxy-cyclohexasiloxane (b.p. 200.5 - 203.5°C,  $d_4^{20}$  0.9857,  $n_D^{20}$  1.4135, yield 5.4%). All these compounds dissolved readily in benzene, toluene, acetone and ethyl ether. Their structure was derived from the IR spectra. Substituting  $NH_2$  for the Cl group in III gave nonamethyl-amino-cyclopentasiloxane (b.p. 134 - 137°C,  $d_4^{20}$  1.0160,  $n_D^{20}$  1.4115, yield 32.2%). There are 1 figure and 1 table.

TITLE: Spectral analysis of vibration and noise, and the characteristics of physiological shifts arising during operation of high-speed polishing machines

SOURCE: Gigiyena i sanitariya, no. 5, 1966, 33-37

14

TOPIC TAGS: vibration, noise, human physiology, vibration effect, noise effect

ABSTRACT: The physiological effects of the noise and vibration parameters of high-speed metal-polishing-machines were studied under industrial conditions. The machines produced vibration amplitudes of 42—145 microns. Depending on the size of the abrasive material used, the frequency of vibration for pneumatic polishers was 320—600 cps, while that of electric polishers was 98—110 cps. A total of 40 healthy male subjects aged 19—39 were examined. Each subject worked with a polisher no more than once a day for 20 min. The skin temperature of the third and fourth fingers of each hand was measured electrically. An oscillograph was used to monitor the state of the brachial artery, and a dynamometer (designed by V. V. Rozenblat) was used to test muscular strength and static endurance of the hand before and after

exposure to vibration. A specially constructed vibrator (100, 200, 400, and 600 cps) was used to test vibration sensitivity. A 20-min exposure to polishing machine parameters was found to increase the threshold of vibration sensitivity statistically. This increase in sensitivity did not normalize for 12-15 min after vibration. The degree of sensitivity increase depended on the type of vibration parameter; of the four frequencies tested, 600 cps was found to cause the greatest increase in sensitivity as reflected in decrease in skin temperature. Vibration did not produce significant shifts in brachial artery oscillograph indexes, muscle strength, or static endurance. Orig. art. has: 2 figures and 3 tables. [CD]

ABSTRACT: Dark coumarone resins (DCR), obtained from cube residue after rectification and cube residue of pyrolysis residue, their copolymers, liquid polymers (LP) and formolites from solvent petroleum can be used as rubber ingredients. The (LP) and (DCR) from cube residues of crude benzene rectification have the highest plasticizing properties. The (LP)'s behavior in mixtures is not inferior to that of dibutyl-phthalate, except for its frostresistance. The (DCR)'s increase

Development of a method for the determination of the degree of defatting of metallic surfaces. V. E. Tattakovskaya and N. B. Ivanova. Byull. Malyarad-Pril. 1938, No. 4, 5, 47-8; Khim. Referat. Zhur. 2, No. 5, 115 (1939).

The method proposed is based on the wpm. of the more noble metals from solns. of their salts on the surfaces of the less noble metals. Five % CuS<sub>2</sub> soln. was taken as an indicator for Fe, Zn, Al and Duralumin and 5% Hg(NH<sub>3</sub>)<sub>2</sub> soln. was taken as an indicator for tatten and Cu. In testing Al and Duralumin a 0.5% soln. of NH<sub>4</sub>Cl was added to the 5% soln. of CuS<sub>2</sub>. The defatted surface was covered with a layer of Cu or Hg. Places covered with fat were not coated by the pptg. metal. W. R. Hamm

The effect of surface active materials on the oil adsorption on pigments. V. E. Tarkovskaya and Yu. G. Khazina. Byull. Obzora Opyt. Tsvetnoy Prom. 1939, No. 3, 40-8. Oleic acid increases oil adsorption on Zn white and on Krivor Rog red iron oxide pigment; this is attributed to lessening in the wetting of pigments and increasing flocculation of their particles with the formation of compact structures from pigment particles, immobilizing the disperse phase and lowering the fluidity of the system. The theory is supported by measurements of the adsorption of oleic acid, detn. of sedimentation rates in H<sub>2</sub>O and in mineral oil, measurement of adsorption when Zn oleate was added, measurement of the final pigment vol., calen. of the thickness of the oil film on the surface of Zn white on mineral oil. Butyric acid and sard. aleo. do not materially change the oil adsorption by the pigments. D.A.

Investigation of inter-solvate exchange of bromine ions in various solvents. S. Z. Roginskii and V. B. Turtukovskaya. *Comp. rend. acad. sci. U. R. S. S.* 24, 709-711 (1930) (in English).—Radioactive halogens were used as indicators in studying the p.t.n. of Ag halide salts from aq.-alc. solns.; an unequal rate of p.t.n. of the halogen ions was found. The conditions necessary for the effect to appear are (1) slowness of inter-solvate exchange, (2) presence of substances that react in different ways with solvato ions of the 3 different types, (3) slowness of the isotopic exchange between the products of (2) and the initial substance in soln. The effect of the lag in inter-solvate exchange was observed in the following systems: (a) EtOH-water, (b) acetone-water, (c) glycerol-water, (d) glycerol-acetone and (e) MeOH-water. Pos. effects were also reported in the p.t.n. of a soln. of  $Hg^{++}$ -ions. The effect has a purely kinetic character (the velocity differs from system to system) and disappears if the soln. is kept at room temp. for a long period of time. The period was found to be shortened by raising the temp. or by the addition of acid. The authors believe that the magnitude and the stability of the effect point to an existence of solvates containing only one of the solvents in the envelope surrounding the ions.
