Electro-Tinning and De-tinning of Steel Sheet. Josef Teindl (*Hornický Věstník*, 1941, 22, 93-97; *Chem. Zentr.*, 1942, 112, (1), 3192; *C. Ab.*, 1943, 87, 3354).—Clean and smooth steel sheet is necessary to produce bright tin coatings. Commercial methods for hot and electrolytic tinning are described. Electro-tinning causes no loss of tin by oxidation, is more economical, and can produce a sheet having 30 grm. of tin/m.² on one side and 5 grm./m.² on the other, whereas 40 grm./m.² on each side is given by hot tinning. Sheet having approx. 3 grm./m.² of tin is satisfactory for lacquering. Porosity in tin coatings cannot be eliminated by either method. Sheet for use in food cans should have 3-5 pores/cm.², although up to 17 have been allowed.

Using Cast Iron and Mild Steel as a Material for Roll Bearings in Rolling Mills. J. Trindl. (Hutnická Listy, 1950, vol. 6, Mar., pp. 97-101). [In Czech]. Cast iron and mild steel bearings were used experimentally in roll stands at several works in Silesia to replace bronze bearings. The compositions of the cast iron and steel used and test data are reported. Drawings show the design of the bearings and stands. The bearing surfaces after use and their microstructures are also illustrated. These materials can be used in stands for hot-rolling thin strip, cast iron being suitable in the top and sides of the bearings. Mild steel is applicable for stands with roll-neck diameters exceeding 600 mm. The type of stand and the lubricant have a great effect on the bearing life.—E. O.

Fundamentals of Tinning Practice. J. Teindl. (*Hutník*. (Prague), 1931, 1, No. 2, 37-39). [In Czech]. Methods of tinning sheet iron, faults arising during and before rolling of the sheet, and in preparing and tinning it are discussed, and some remedies considered. The qualities, dimensions, and uses of tinplate are mentioned. -- P. 7.

3814* Phosphorus in Tin Plate in Soviet Practice. (In Czech.) Josef Trnád. *Hutnické Listy*, v. 6, Nov. 1951, p. 546-549.

In Soviet practice, it was found that a phosphorus content of 0.08-0.10% is the best for preventing sticking of sheets. It is necessary to melt phosphorus steel in an openhearth furnace with a basic slag in order to retain the special properties desired.

The Formation of White Spots on High-Gloss Tinned Sheet.
(Czech.) The occurrence of grey patches and white spots was observed on large tinned sheets (80-120 g. tin per sq. m.), all of which had been hot-rolled. The primary cause of the formation of white spots was the presence of oily films and reaction products formed during bright-annealing. Clean surfaces and constant control of the tinning process are necessary to reduce the rejects thus caused.—P. T.

TEINDL, J.

Dependence of Pickling Losses on the Method of Rolling
Thin Steel Sheet. J. Teindl. *Hutnická Listy*, 1953, 8, 1,
129-134. [In Czech.] The theory of the pickling of steel sheet
is explained and the influence of sheet thickness, surface
films, method of rolling, and annealing furnace atmosphere
is considered on the basis of the author's and other workers'
experimental material. The method of rolling and the
furnace atmosphere are of primary importance owing to their
influence on the nature of the steel surface.—r. v.

✓ Theory of Hot-Galvanized Metal Coatings. Josef Teindl
(*Hutnická Listy*, 1954, 8, 731-735; *C. Abh.*, 1955, 48, 2474).
ME [In Czech]. Some questions are considered concerning hot-
galvanized metal coatings, especially fluxes and their effect
on quality of metal coatings on galvanized and tinned
sheets. The structure of these coatings, the effect of addn.
to the steel and to the molten-metal bath, and especially the
effect of Al in hot-galvanizing, are examined.

Title : Corrosion of Mine Cables and Its Causes

Orig Pub : Hutnicke listy, 1956, 11, No 2, 77-86

Abstract : On the basis of literature data the following questions were considered: effect of the surface condition of the wire on fatigue corrosion arising on variable stresses; mechanism of formation and growth of microfissures in the metal; significance of lubrication, zinc coating and polishing, as concerns protection of the wire; effect of treatment processes, structure and coppering on corrosion of the cable. Investigated was the rate of corrosion of two cables, one of which had not been in use and the other used for 3 months.

Title : Corrosion of Wire Drawn After Zinc-Plating.

Orig Pub : Hutnicke listy, 1956, 11, No 2, 99-102

Abstract : The technology of drawing of zinc-plated wire (W) is considered, as well as the corrosion resistance (CR) of the wire. To enhance the CR use should be made of carbon-steel W and the hot Zn-coating conducted in pure Zn; in drawing, during the last passes, a neutral emulsion should be used. The described technology of drawing makes it possible to decrease expenditure of Zn and electric power, to enhance the mechanical characteristics of the W, extend the life of drawing machines and improve the condition of the surface of the W.

Title : Corrosion of the Inside Surfaces of Tin Cans

Orig Pub: Prumysl potraviny, 1957, 8, No 2, 68-73

Abstract: Description of the corrosion of the inside sur-
face of tin cans, and of studies of the sulfide
layer that is formed. It is proposed to treat
the cans with a passivating solution of the
following composition (in grams per liter):
Na₃PO₄ 9, Na₂Cr₂O₇·2H₂O 8, NaOH 20, wetting
agent (for example, alkyl sulfonate) 3.
